LS-DYNA MULTIPHYSICS USER'S MANUAL

INTRODUCTION

In this manual, there are five main solvers: two compressible flow solvers, an incompressible flow solver, an electromagnetism solver, and a battery electrochemistry solver. Each of them implements coupling with the structural solver in LS-DYNA.

The keywords covered in this manual fit into one of three categories. In the first category are the keyword cards that provide input to each of the multiphysics solvers that in turn couple with the structural solver. In the second category are keyword cards involving extensions to the basic solvers. Presently, the chemistry and stochastic particle solvers are the two solvers in this category, and they are used in conjunction with the *CESE compressible flow solver discussed below. In the third category are keyword cards for support facilities. A volume mesher that creates volume tetrahedral element meshes from bounding surface meshes is one of these tools. Another is a data output mechanism for a limited set of variables from some of the solvers in this manual. This mechanism is accessed through *LSO keyword cards.

The CESE solver is a compressible flow solver based upon the Conservation Element/Solution Element (CE/SE) method, originally proposed by Chang of the NASA Glenn Research Center. This method is a novel numerical framework for conservation laws. It has many non-traditional features, including a unified treatment of space and time, the introduction of separate conservation elements (CE) and solution elements (SE), and a novel shock capturing strategy without using a Riemann solver. This method has been used to solve many types of flow problems, such as detonation waves, shock/acoustic wave interaction, cavitating flows, supersonic liquid jets, and chemically reacting flows. In LS-DYNA, it has been extended to also solve fluidstructure interaction (FSI) problems. It does this with two approaches. The first approach solves the compressible flow equations on an Eulerian mesh while the structural mechanics is solved on a moving mesh that moves through the fixed CE/SE mesh. In the second approach (new with this version), the CE/SE mesh moves in a fashion such that its FSI boundary surface matches the corresponding FSI boundary surface of the moving structural mechanics mesh. This second approach is more accurate for FSI problems, especially with boundary layers flows. Another feature with the CESE moving mesh solver is conjugate heat transfer coupling with the solid thermal solver. The chemistry and stochastic particle solvers are two addon solvers that extend the CESE solver.

The dual CESE solver is another compressible flow solver that is also based upon the Conservation Element/Solution Element (CE/SE) method, but with improvements

related to accuracy and robustness. This method follows a similar novel numerical framework for conservation laws. In LS-DYNA, the dual CESE solver also include fluid-structure interaction (FSI) capabilities. It also does this with two approaches. The first approach solves the compressible flow equations on an Eulerian mesh while the structural mechanics is solved on a moving mesh that moves through the fixed dual CE/SE mesh. In the second approach. the dual CE/SE mesh moves in a fashion such that its FSI boundary surface matches the corresponding FSI boundary surface of the moving structural mechanics mesh. This second approach is more accurate for FSI problems, especially with boundary layers flows. One of the advances in these FSI computations with the dual CESE solver as compared with the older CESE solver is that each FSI approach (or fixed mesh Eulerian solver) may be employed in different subregions of the fluid mesh in the same problem. Unlike the *CESE solvers, the dual CESE solvers do not yet have conjugate heat transfer coupling with the solid thermal solver, nor coupling with the chemistry or stochastic particle solvers. Another advance available only with the dual CESE solvers is the availability of equations of state for pure and pseudo-pure fluids of industrial interest in the REFPROP and COOLPROP EOS libraries. These complex EOSes are generally expensive to evaluate, so a bi-cubic table look-up mechanism has been developed that greatly accelerates their use.

The third solver is the incompressible flow solver (ICFD) that is fully coupled with the solid mechanics solver. This coupling permits robust FSI analysis via either an explicit technique when the FSI is weak, or using an implicit coupling when the FSI coupling is strong. In addition to being able to handle free surface flows, there is also a bi-phasic flow capability that involves modeling using a conservative Lagrangian interface tracking technique. Basic turbulence models are also supported. This solver is the first in LS-DYNA to make use of a new volume mesher that takes surface meshes bounding the fluid domain as input (*MESH keywords). In addition, during the time advancement of the incompressible flow, the solution is adaptively re-meshed as an automatic feature of the solver. Another important feature of the mesher is the ability to create boundary layer meshes. These anisotropic meshes become a crucial part of the model when shear stresses are to be calculated near fluid walls. The ICFD solver is also coupled to the solid thermal solver using a monolithic approach for conjugate heat transfer problems.

The fourth solver is an electromagnetics (EM) solver. This module solves the Maxwell equations in the Eddy current (induction-diffusion) approximation. This is suitable for cases where the propagation of electromagnetic waves in air (or vacuum) can be considered as instantaneous. Therefore, the wave propagation is not solved. The main applications are Magnetic Metal Forming, bending or welding, induced heating, ring expansions and so forth. The EM module allows the introduction of a source of electrical current into solid conductors and the computation of the associated magnetic field, electric field, as well as induced currents. The EM solver is coupled with the structural mechanics solver (the Lorentz forces are added to the mechanics equations of motion), and with the structural thermal solver (the ohmic heating is added to the thermal solver as an extra source of heat). The EM fields are solved using a Finite

Element Method (FEM) for the conductors and a Boundary Element Method (BEM) for the surrounding air/insulators. Thus no air mesh is necessary.

The fifth solver is a battery electrochemistry solver. At this time, the available capability involves a one-dimensional electrochemistry solver that is coupled to the structural mechanics and structural thermal solver in each structural element identified as being part of a battery cell. It solves these one-dimensional models implicitly so as to be able to run simulations for very long physical times that are typical of battery-structure interaction problems.

As stated above, the *CHEMISTRY and *STOCHASTIC cards are only used in the CESE solver at this time.

*BATTERY

The keyword *BATTERY provides input data for the electrochemistry solver:

- *BATTERY_ECHEM_CELL_GEOMETRY
- *BATTERY_ECHEM_CONTROL_SOLVER
- *BATTERY_ECHEM_INITIAL
- *BATTERY_ECHEM_MAT_ANODE
- *BATTERY_ECHEM_MAT_CATHODE
- *BATTERY_ECHEM_MAT_ELECTROLYTE
- *BATTERY_ECHEM_PART
- *BATTERY_ECHEM_THERMAL

For now, the available capability involves a one-dimensional electrochemistry solver that is coupled to the structural mechanics and structural thermal solver in each structural element identified as being part of a battery cell.

LS-DYNA R12 2-1 (BATTERY)

*BATTERY_ECHEM_CELL_GEOMETRY

Purpose: Set general-purpose geometry variables for a single cell BATTERY model.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|--------|------|------|------|--------|--------|---|---|
| Variable | IMODEL | ALEN | SLEN | CLEN | ACCLEN | CCCLEN | | |
| Туре | I | F | F | F | F | F | | |
| Default | none | none | none | none | none | none | | |
| Remarks | 1 | | | | | | | |

| Card 2 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
|----------|-------|-------|-------|---------|---------|---|---|
| Variable | AMESH | SMESH | CMESH | ACCMESH | CCCMESH | | |
| Туре | I | I | I | I | I | | |
| Default | none | none | none | none | none | | |
| Remarks | | | | | | | |

| VARIABLE | DESCRIPTION |
|----------|---|
| IMODEL | A battery model identifier. |
| ALEN | The length of anode side electrode. |
| SLEN | The length of separator. |
| CLEN | The length of cathode side electrode. |
| ACCLEN | The length of negative current collector. |
| CCCLEN | The length of positive current collector. |
| AMESH | The number of anode side meshes. |
| | |

2-2 (BATTERY) LS-DYNA R12

| VARIABLE | DESCRIPTION |
|----------|---|
| SMESH | The number of separator. |
| CMESH | The number of cathode side electrode. |
| ACCMESH | The number of negative current collector. |
| CCCMESH | The number of positive current collector. |

Remarks:

1. The battery model identifier (IMODEL) should match the IMODEL value specified in the corresponding *BATTERY_ECHEM_CONTROL_SOLVER card. In case a different value is given, the value on the *BATTERY_ECHEM_CONTROL_SOLVER card will be the default.

LS-DYNA R12 2-3 (BATTERY)

*BATTERY_ECHEM_CONTROL_SOLVER

Purpose: Set general purpose control variables for a BATTERY simulation.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|--------|-------|-------|--------|---|---|---|---|
| Variable | IMODEL | IGEOM | IMODE | NCYCLE | | | | |
| Туре | I | I | I | I | | | | |
| Default | none | none | 1 | 1 | | | | |
| Remarks | | | 1 | 2 | | | | |

| Card 2 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|------|-------|------|---|---|---|
| Variable | IRUN | LCUR | CURV | CTIME | VCUT | | | |
| Туре | I | I | F | F | F | | | |
| Default | none | none | none | none | none | | | |
| Remarks | | | 3 | | | | | |

VARIABLE DESCRIPTION

IMODEL Sets the battery model.

EQ.1: A single insertion model

EQ.2: Dual insertion model

EQ.3: Non-porous model (not working)

IGEOM Sets the geometric dimension:

EQ.1: A single cell (1D) problem

EQ.2: Two-dimensional (2D) problem (not working)

EQ.3: Three-dimensional (3D) problem (not working)

EQ.101: A single cell with thermal coupling

2-4 (BATTERY) LS-DYNA R12

| VARIABLE | DESCRIPTION |
|----------|---|
| IMODE | Battery running mode identifier. |
| | EQ.1: Galvanostatic run |
| | EQ.2: Potentiostatic run (not working) |
| NCYCLE | The number of cycles to run. Default is 1 cycle |
| IRUN | Battery simulation running or terminating identifier |
| | EQ.1: The current cycle runs for a given time |
| | EQ.2: The current cycle runs until the cell voltage reaches VCUT. |
| LCUR | Running current. |
| | EQ.0: Constant current. |
| | EQ.1: Variable current. |
| CURV | Current/Voltage value to run. |
| CTIME | Running time for each cycle. |
| VCUT | Cutoff voltage to terminate. |

Remarks:

- 1. Default simulation for the Battery model is galvanostatic charge/discharge mode. A potentiostatic mode is simulated by running the galvanostatic mode until the desired cell potential is achieved via iteration of the cell current density. Currently, this is not working.
- 2. When the number of cycles is more than 1, one "Card 2" must be included for each of the cycles.
- 3. When LCUR is equal to 1, the value of CURV will be the initial current to run.

LS-DYNA R12 2-5 (BATTERY)

Default

none

none

none

*BATTERY_ECHEM_INITIAL

Purpose: Initializes all simulation mesh points in the composite electrodes and electrolyte in every element of the BATTERY.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |

VARIABLE DESCRIPTION

PID Part number identifier

LS-DYNA R12 2-7 (BATTERY)

| VARIABLE | DESCRIPTION |
|----------|--|
| IOCPA | Material identifier for the open-circuit potential. |
| | EQ.1: Lithium metal foil. |
| | EQ.2: Titanium disulfide, LixTiS2 ($0 < x < 1$). |
| | EQ.3: Petroleum coke, Carbon. |
| | EQ.4: MCMB 2510 carbon. |
| | EQ.5: MCMB 2528 carbon. |
| CAPTA | Coulombic capacity of anode material. (mAh/g) |
| S_XA | Initial Lithium stoichiometric coefficient of the anode side active material. For example, $\text{Li}_x WO_3 (0 < x < 0.67)$. |
| RADA | Radius of spherical particles in the anode side active material. (m) |
| RATEA | Reaction rate constant for the anode electrode. |
| RANODE | Film resistance for the anode electrode. |
| RHOEA | Density of anode insertion material (electrode particles). (Kg/m³) |
| RHOFA | Density of the anode side inert filler. (Kg/m³) |
| RHOCCA | Density of the anode side current collector. (Kg/m^3) |
| DIFFA | Diffusion coefficient of Lithium ions in the anode insertion material. $\left(m^2/s\right)$ |
| CONDA | Effective electronic conductivity of the anode porous electrode. (S/m) . |
| VFEA | Volume fraction of electrolyte in the anode electrode. |
| VFPA | Volume fraction of the polymer phase in the anode electrode. |
| VFFA | Volume fraction of the inert filler in the anode electrode. |
| VFGA | Volume fraction of the gas in the anode electrode. |

2-8 (BATTERY) LS-DYNA R12

LS-DYNA R12 2-9 (BATTERY)

| VARIABLE | DESCRIPTION |
|----------|---|
| IOCPC | Material identifier for the open-circuit potential. |
| | EQ.1: Titanium disulfide, LiyTiS2 (0 < y<1). |
| | EQ.2: Spinel Mn2O4 (lower plateau) (1.1 < y<1.99). |
| | EQ.3: Cobalt dioxide, LiyCoO2 (0.0 < y<0.99). |
| | EQ.4: Spinel Mn2O4 (upper plateau) (0.17 < y < 0.99). |
| | EQ.5: NMC-111 (not working). |
| | EQ.6: NMC-811 (not working). |
| | EQ.7: LFP (not working). |
| CAPTC | Coulombic capacity of the cathode material. (mAh/g) |
| S_YC | Initial Lithium stoichiometric coefficient of the cathode side active material. For example Li_yWO_3 (0 < y<0.67). |
| S_RAD | Radius of spherical particle in the cathode side active material. (m) |
| RATEC | Reaction rate constant for the cathode electrode. |
| RCATH | Film resistance for the cathode electrode. |
| RHOEC | Density of the cathode insertion material (electrode particles). (Kg/m^3) |
| RHOFC | Density of the cathode side inert filler. (Kg/m³) |
| RHOCCC | Density of the cathode side current collector. (Kg/m³) |
| DIFFC | Diffusion coefficient of Lithium ions in the cathode insertion material. (m^2/s) |
| CONDC | Effective electronic conductivity of the cathode porous electrode. (S/m) . |
| VFEC | Volume fraction of electrolyte in the cathode electrode. |
| VFPC | Volume fraction of the polymer phase in the cathode electrode. |
| VFFC | Volume fraction of the inert filler in the cathode electrode. |
| VFGC | Volume fraction of the gas in the cathode electrode. |

| VARIABLE | DESCRIPTION |
|----------|---|
| PID | Part identifier (must be different from any PID on a *PART card) |
| MID | Material identifier defined by *ECHEM_BATTERY_MAT card |
| EOSID | Equation of state identifier defined using a *ECHEM_BATTERYEOS card |

LS-DYNA R12 2-13 (BATTERY)

*BATTERY_ECHEM_THERMAL

Purpose: Set parameters for the thermal treatment in a cell stack.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|------|------|------|-------|------|------|---|
| Variable | TNAME | TID | IPRT | СР | HCONV | TEMP | DUDT | |
| Туре | А | I | I | F | F | F | F | |
| Default | none | none | none | none | none | none | none | |
| Remarks | | | | 2 | 2 | 2 | | |

| VARIABLE | DESCRIPTION |
|----------|--|
| TNAME | Thermal material identifier |
| TID | Material identifier |
| | EQ.0: Constant temperature mode. |
| | EQ.1: Isothermal temperature with time. |
| | EQ.2: Thermal coupling with LS-DYNA thermal solver. |
| IPRT | Data print in ASCII format |
| | EQ.0: No data print out. |
| | EQ.1: Time vs. heat flux print out for thermal solver. |
| | EQ.2: Time vs. cell temperature print out. |
| СР | The specific heat coefficient of the cell. (J/Kg K) |
| HCONV | Convective heat transfer coefficient with external medium. (W/m^2K) |
| TEMP | Ambient temperature around the cell stack. (K) |
| DUDT | The temperature coefficient of open circuit potential (V/K) . |
| | EQ.0: Constant coefficient given by MULT. |
| | EQ.1: Coefficient as function of temperature. |
| | |

2-14 (BATTERY) LS-DYNA R12

Remarks:

- 1. In case of thermal-mechanical coupling, the part number for the battery simulation must be specified, so only this part number is considered in the battery parts.
- 2. If TID is 2, these values are set through the THERMAL Material card. including anisotropic conductivities (see *MAT_THERMAL_ORTHOTROPIC).

Example:

The following is a partial example for 1D Electrochemisty.

3-2 (CESE) LS-DYNA R12

*CESE_BOUNDARY_AXISYMMETRIC_OPTION

Available options are

MSURF

MSURF_SET

SET

SEGMENT

Purpose: Define an axisymmetric boundary condition on the axisymmetric axis for the 2D axisymmetric CESE compressible flow solver.

The MSURF and MSURF_SET options are used when the CESE mesh has been created using *MESH cards. The SET and SEGMENT cards are used when *ELEMENT_SOLID cards are used to define the CESE mesh.

Surface Part Card. Card 1 format used when the MSURF keyword option is active. Provide as many cards as necessary. This input ends at the next keyword ("*") card.

| Card 1a | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|---------|---|---|---|---|---|---|---|
| Variable | MSURFID | | | | | | | |
| Туре | I | | | | | | | |

| VARIABLE | DESCRIPTION |
|----------|---|
| MSURFID | Mesh surface part ID referenced in *MESH_SURFACE_ELE-MENT cards. |
| MSURF_S | Identifier of a set of mesh surface part IDs created with a *LSOID_SET card, where each mesh surface part ID in the set is referenced in *MESH_SURFACE_ELEMENT cards. |
| SSID | Segment set ID |
| N1, N2, | Node IDs defining a segment |

Remarks:

1. This boundary condition can only be used on the axisymmetric axis for the 2D axisymmetric CESE fluid solver.

3-4 (CESE) LS-DYNA R12

*CESE_BOUNDARY_BLAST_LOAD_OPTION

Available options include:

MSURF

MSURF_SET

SET

SEGMENT

Purpose: For the CESE compressible flow solver, set boundary values for velocity, density, and pressure from a blast wave defined by a *LOAD_BLAST_ENHANCED card. Boundary values are applied at the centroid of elements connected with this boundary. OPTION = SET and OPTION = SEGMENT are for user defined meshes whereas OPTION = MSURF or MSURF_SET are associated with the automatic volume mesher (See *MESH keywords).

That is, the MSURF and MSURF_SET options are used when the CESE mesh has been created using *MESH cards. The SET and SEGMENT cards are used when *ELE-MENT_SOLID cards are used to define the CESE mesh.

Surface Part Card. Card 1 format used when the MSURF keyword option is active.

| Default | none | none | none | none | none | | | |

| VARIABLE | DESCRIPTION |
|----------|---|
| BID | Blast source ID (see *LOAD_BLAST_ENHANCED). |
| MSURFID | A mesh surface part ID referenced in *MESH_SURFACE_ELE-MENT cards |
| MSURF_S | Identifier of a set of mesh surface part IDs created with a *LSOID_SET card, where each mesh surface part ID in the set is referenced in *MESH_SURFACE_ELEMENT cards. |
| SSID | Segment set ID |
| N1, N2, | Node ID's defining a segment |

3-6 (CESE) LS-DYNA R12

*CESE_BOUNDARY_CONJ_HEAT_OPTION

Available options are:

MSURF

MSURF_SET

SET

SEGMENT

Purpose: Define a conjugate heat transfer interface condition for CESE compressible flows. This condition identifies those boundary faces of the CESE mesh that are in contact with non-moving structural parts, and through which heat flows. This is only possible when the structural thermal solver is also in being used in the structural parts.

The MSURF and MSURF_SET options are used when the CESE mesh has been created using *MESH cards. The SET and SEGMENT cards are used when *ELEMENT_SOLID cards are used to define the CESE mesh.

Surface Part Card. Card 1 used when the MSURF keyword option is active. Include as many cards as necessary. This input ends at the next keyword ("*") card.

| Card 1a | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|---------|---|---|---|---|---|---|---|
| Variable | MSURFID | | | | | | | |
| Туре | I | | | | | | | |
| Default | none | | | | | | | |

Surface Part Set Card. Card 1 used when the MSURF_SET keyword option is active. Include as many cards as necessary. This input ends at the next keyword ("*") card.

| Card 1b | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|---------|---|---|---|---|---|---|---|
| Variable | MSURF_S | | | | | | | |
| Туре | I | | | | | | | |
| Default | none | | | | | | | |

LS-DYNA R12 3-7 (CESE)

| Set Card. Card 1 used when the SET keyword option is active. | Include as many cards |
|---|-----------------------|
| as necessary. This input ends at the next keyword ("*") card. | |

| Card 1c | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|---|---|---|---|---|---|---|
| Variable | SSID | | | | | | | |
| Туре | I | | | | | | | |
| Default | none | | | | | | | |

Segment Cards. Card 1 used when SEGMENT keyword option is active. Include an additional card for each corresponding pair of segments. This input ends at the next keyword ("*") card.

| Card 1d | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|------|------|---|---|---|---|
| Variable | N1 | N2 | N3 | N4 | | | | |
| Туре | 1 | I | I | I | | | | |
| Default | none | none | none | none | | | | |

| VARIABLE | DESCRIPTION |
|----------|--|
| MSURFID | Mesh surface part ID referenced in *MESH_SURFACE_ELE-MENT cards. |
| MSURF_S | Identifier of a set of mesh surface part IDs created with an *LSOID_SET card, where each mesh surface part ID in the set is referenced in *MESH_SURFACE_ELEMENT cards. |
| SSID | Segment set ID |
| N1, N2, | Node IDs defining a segment |

Remarks:

1. This boundary condition should only be imposed on a CESE mesh boundary that is in contact with non-moving structural parts. An Eulerian CESE solver is required, as is use of the structural thermal solver.

3-8 (CESE) LS-DYNA R12

*CESE_BOUNDARY_CYCLIC_OPTION

Available options are:

MSURF

MSURF_SET

SET

SEGMENT

Purpose: Define a cyclic (periodic) boundary condition for CESE compressible flows. This cyclic boundary condition (CBC) can be used on periodic boundary surfaces.

The MSURF and MSURF_SET options are used when the CESE mesh has been created using *MESH cards. The SET and SEGMENT cards are used when *ELEMENT_SOLID cards are used to define the CESE mesh.

Card Sets. The following sequence of cards comprises a *single set*. LS-DYNA will continue reading *CESE_BOUNDARY_SOLID_WALL card sets until the next keyword ("*") card is encountered.

Surface Part Card. Card 1 format used when the MSURF keyword option is active.

| Card 1a | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|----------|----------|--------|---|---|---|---|---|
| Variable | MSURFID1 | MSURFID2 | СҮСТҮР | | | | | |

Translation Case Card. Additional card for the MSURF, MSURF_SET, and SET options when CYCTYP = 2.

| Card 2b | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|--------|--------|--------|---|---|---|---|---|
| Variable | TRANSX | TRANSY | TRANSZ | | | | | |
| Туре | F | F | F | | | | | |
| Default | none | none | none | | | | | |

| VARIABLE | DESCRIPTION |
|-----------------------|---|
| MSURFID1, MSURFID2 | Mesh surface part numbers referenced in *MESH_SURFACEELEMENT cards. |
| MSRF_S1, MSRF_S2 | Identifiers of two sets of mesh surface part IDs, each created with a *LSO_ID_SET card, where each mesh surface part ID in each set is referenced in *MESH_SURFACE_ELEMENT cards. |
| СҮСТҮР | Relationship between the two cyclic boundary condition surfaces: |
| | EQ.0: none assumed (default) |
| | EQ.1: The first surface is rotated about an axis to match the second surface. |
| | EQ.2: The faces of the first surface are translated in a given direction to obtain the corresponding faces on the second surface. |
| SSID1 & SSID2 | A pair of segment set IDs |

LS-DYNA R12 3-11 (CESE)

| NDi, NPi | Node IDs defining a pair of segments: ND1, ND2, ND3, ND4 define the first segment, while NP1, NP2, NP3, NP4 define the second segment. This pair of segments must match either through a geometric translation or rotation. |
|--------------|---|
| AXIS[Z,Y,Z]1 | A point on the axis of rotation for CYCTYP.EQ.1. |
| DIR[X,Y,Z] | The direction which together with AXIS[X,Y,Z]1 defines the axis of rotation for CYCTYP.EQ.1. |
| ROTANG | The angle of rotation (in degrees) that transforms the centroid of each face on the first surface to the centroid of the corresponding face on the second surface (for CYCTYP.EQ.1). |
| TRANS[X,Y,Z] | The translation direction that enables the identification of the segment in the second surface that matches a segment in the first surface (for CYCTYP.EQ.2). |

Remarks:

- 1. For the MSURF, MSURF_SET, or SET options with CYCTYP.EQ.0, the code examines the geometry of two faces of the two surfaces in order to determine if the surfaces are approximately parallel (CYCTYP.EQ.2), or related through a rotation (CYCTYP.EQ.1). The geometric parameters required are then computed.
- 2. For the MSURF option, there must be the same number of mesh surface elements in each mesh surface part, and the mesh surface elements in each mesh surface part are then internally ordered in order to match pairwise between the two mesh surface parts.
- 3. For the MSURF_SET option, there must be the same number of mesh surface elements in each mesh surface part set, and the mesh surface elements in each mesh surface part set are then internally ordered in order to match pairwise between the two mesh surface part sets.
- 4. For the SET option, there must be the same number of segments in each set, and the segments in each set are then internally ordered in order to match pairwise between the two sets.

3-12 (CESE) LS-DYNA R12

*CESE_BOUNDARY_FSI_OPTION

Available options are:

MSURF

MSURF_SET

SET

SEGMENT

Purpose: Define an FSI boundary condition for the moving mesh CESE compressible flow solver. This card must not be combined with the immersed-boundary method CESE solver, and doing so will result in an error termination condition.

This boundary condition must be applied on a surface of the CESE computational domain that is co-located with surfaces of the outside boundary of the structural mechanics mesh. The nodes of the two meshes will generally not be shared.

The MSURF and MSURF_SET options are used when the CESE mesh has been created using *MESH cards. The SET and SEGMENT cards are used when *ELEMENT_SOLID cards are used to define the CESE mesh.

Surface Part Card. Card 1 format used when the MSURF keyword option is active. Provide as many cards as necessary. This input ends at the next keyword ("*") card.

| Card 1a | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |

|-----------------------|----------|--------|-------|------|
|-----------------------|----------|--------|-------|------|

MSURF

MSURF_SET

SET

SEGMENT

Purpose: Define a passive boundary condition for CESE compressible flows. This non-reflective boundary condition (NBC) provides an artificial computational boundary for an open boundary that is passive.

The MSURF and MSURF_SET options are used when the CESE mesh has been created using *MESH cards. The SET and SEGMENT cards are used when *ELEMENT_SOLID cards are used to define the CESE mesh.

Surface Part Card. Card 1 used when the MSURF keyword option is active. Include as many cards as necessary. This input ends at the next keyword ("*") card.

| Card 1a | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |

| Туре | I | | | | | | | |
| Default | none | | | | | | | |

Surface Part Set Card. Card 1 used when the MSURF_SET keyword option is active. Include as many cards as necessary. This input ends at the next keyword ("*") card.

| Card 1b | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|---------|---|---|---|---|---|---|---|
| Variable | MSURF_S | | | | | | | |
| Туре | I | | | | | | | |
| Default | none | | | | | | | |

3-16 (CESE) LS-DYNA R12

Set Card. Card 1 used when the SET keyword option is active. Include as many cards as necessary. This input ends at the next keyword ("*") card.

| Card 1c | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|---|---|---|---|---|---|---|
| Variable | SSID | | | | | | | |
| Туре | I | | | | | | | |
| Default | none | | | | | | | |

Segment Cards. Card 1 used when SEGMENT keyword option is active. Include an additional card for each corresponding pair of segments. This input ends at the next keyword ("*") card.

| Card 1d | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|------|------|---|---|---|---|
| Variable | N1 | N2 | N3 | N4 | | | | |
| Туре | I | I | I | I | | | | |
| Default | none | none | none | none | | | | |

| VARIABLE | DESCRIPTION |
|----------|--|
| MSURFID | Mesh surface part ID referenced in *MESH_SURFACE_ELE-MENT cards. |
| MSURF_S | Identifier of a set of mesh surface part IDs created with an *LSOID_SET card, where each mesh surface part ID in the set is referenced in *MESH_SURFACE_ELEMENT cards. |
| SSID | Segment set ID |
| N1, N2, | Node IDs defining a segment |

Remarks:

1. This boundary condition is usually imposed on an open surface that is far from the main disturbed flow (the further away, the better), i.e., the flow on that boundary surface should be almost uniform.

LS-DYNA R12 3-17 (CESE)

2. If any boundary segment has not been assigned a boundary condition by any of the *CESE_BOUNDARY_... cards, then it will automatically be assigned this non-reflective boundary condition.

3-18 (CESE) LS-DYNA R12

*CESE_BOUNDARY_PRESCRIBED_OPTION

Available options include:

MSURF

MSURF_SET

SET

SEGMENT

Purpose: For the CESE compressible flow solver, set boundary values for velocity, density, pressure and temperature. Boundary values are applied at the centroid of elements connected with this boundary. OPTION = SET and OPTION = SEGMENT are for user defined meshes whereas OPTION = MSURF or MSURF_SET are associated with the automatic volume mesher (See *MESH keywords).

That is, the MSURF and MSURF_SET options are used when the CESE mesh has been created using *MESH cards. The SET and SEGMENT cards are used when *ELE-MENT_SOLID cards are used to define the CESE mesh.

Card Sets:

A set of data cards for this keyword consists of 3 of the following cards:

- 1. Card 1 specifies the object to which the boundary condition is applied. Its format depends on the keyword option.
- 2. Card 2 reads in load curve IDs.
- 3. Card 3 reads in scale factors.

For each boundary condition to be specified include one set of cards. This input ends at the next keyword ("*") card.

Surface Part Card. Card 1 format used when the MSURF keyword option is active.

| Card 1a | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |

| Default | 1.0 | 1.0 | 1.0 | 1.0 | 1.0 | 1.0 | | |
| Remarks | 2 | 2 | 2 | 2 | 2 | 2 | | |

| VARIABLE | DESCRIPTION |
|----------|--|
| MSURFID | A mesh surface part ID referenced in *MESH_SURFACE_ELE-MENT cards |
| MSURF_S | Identifier of a set of mesh surface part IDs created with a *LSOID_SET card, where each mesh surface part ID in the set is referenced in *MESH_SURFACE_ELEMENT cards. |
| SSID | Segment set ID |
| N1, N2, | Node ID's defining a segment |
| IDCOMP | For inflow boundaries in problems involving chemical reacting flows, the chemical mixture of the fluid entering the domain is defined with a *CHEMISTRY_COMPOSITION card with this ID. |
| LC_U | Load curve ID to describe the x-component of the velocity versus time; see *DEFINE_CURVE. |

LS-DYNA R12 3-21 (CESE)

| VARIABLE | DESCRIPTION |
|----------|--|
| LC_V | Load curve ID to describe the y-component of the velocity versus time. |
| LC_W | Load curve ID to describe the z-component of the velocity versus time. |
| LC_RHO | Load curve ID to describe the density versus time. |
| LC_P | Load curve ID to describe the pressure versus time. |
| LC_T | Load curve ID to describe the temperature versus time. |
| SF_U | Scale factor for LC_U (default = 1.0). |
| SF_V | Scale factor for LC_V (default = 1.0). |
| SF_W | Scale factor for LC_W (default = 1.0). |
| SF_RHO | Scale factor for LC_RHO (default = 1.0). |
| SF_P | Scale factor for LC_P (default = 1.0). |
| SF_T | Scale factor for LC_T (default = 1.0). |

Remarks:

- 1. On each centroid or set of centroids, the variables $(v_x, v_y, v_z, \rho, P, T)$ that are given values must be consistent and make the model well-posed (i.e., be such that the solution of the model exists, is unique and physical).
- 2. If any of the load curves are 0, the corresponding variable will take the constant value of the corresponding scale factor. For instance, if LC_RHO = 0, then the constant value of the density for this boundary condition will be SF_RHO.
- 3. If a load ID is -1 for a given variable, then the boundary value for that variable is computed by the solver, and not specified by the user.

3-22 (CESE) LS-DYNA R12

*CESE_BOUNDARY_PRESCRIBED_VN_OPTION

Available options include:

MSURF

MSURF_SET

SET

SEGMENT

Purpose: For the CESE compressible flow solver, set boundary values for velocity, density, pressure and temperature. Boundary values are applied at the centroid of elements connected with this boundary. OPTION = SET and OPTION = SEGMENT are for user defined meshes whereas OPTION = MSURF or MSURF_SET are associated with the automatic volume mesher (See *MESH keywords).

That is, the MSURF and MSURF_SET options are used when the CESE mesh has been created using *MESH cards. The SET and SEGMENT cards are used when *ELE-MENT_SOLID cards are used to define the CESE mesh.

Card Sets:

A set of data cards for this keyword consists of 3 of the following cards:

- 1. Card 1 specifies the object to which the boundary condition is applied. Its format depends on the keyword option.
- 2. Card 2 reads in load curve IDs.
- 3. Card 3 reads in scale factors.

For each boundary condition to be specified include one set of cards. This input ends at the next keyword ("*") card.

| VARIABLE | DESCRIPTION |
|----------|--|
| MSURFID | A mesh surface part ID referenced in *MESH_SURFACE_ELE-MENT cards |
| MSURF_S | Identifier of a set of mesh surface part IDs created with a *LSOID_SET card, where each mesh surface part ID in the set is referenced in *MESH_SURFACE_ELEMENT cards. |
| SSID | Segment set ID |
| N1, N2, | Node ID's defining a segment |
| IDCOMP | For inflow boundaries in problems involving chemical reacting flows, the chemical mixture of the fluid entering the domain is defined with a *CHEMISTRY_COMPOSITION card with this ID. |
| LC_VN | Load curve ID to describe the normal velocity versus time; see *DEFINE_CURVE. |

LS-DYNA R12 3-25 (CESE)

| VARIABLE | DESCRIPTION |
|----------|--|
| LC_RHO | Load curve ID to describe the density versus time. |
| LC_P | Load curve ID to describe the pressure versus time. |
| LC_T | Load curve ID to describe the temperature versus time. |
| SF_VN | Scale factor for LC_VN (default = 1.0). |
| SF_RHO | Scale factor for LC_RHO (default = 1.0). |
| SF_P | Scale factor for LC_P (default = 1.0). |
| SF_T | Scale factor for LC_T (default = 1.0). |

Remarks:

- 1. On each centroid or set of centroids, the variables (V_N , ρ , P, T) that are given values must be consistent and make the model well-posed (i.e., be such that the solution of the model exists, is unique and physical).
- 2. If any of the load curves are 0, the corresponding variable will take the constant value of the corresponding scale factor. For instance, if LC_RHO = 0, then the constant value of the density for this boundary condition will be SF_RHO.
- 3. If a load ID is -1 for a given variable, then the boundary value for that variable is computed by the solver, and not specified by the user.

3-26 (CESE) LS-DYNA R12

*CESE_BOUNDARY_REFLECTIVE_OPTION

Available options are:

MSURF

MSURF_SET

SET

SEGMENT

Purpose: Define a reflective boundary condition (RBC) for the CESE compressible flow solver. This boundary condition can be applied on a symmetrical surface or a solid wall of the computational domain.

The MSURF and MSURF_SET options are used when the CESE mesh has been created using *MESH cards. The SET and SEGMENT cards are used when *ELEMENT_SOLID cards are used to define the CESE mesh.

Surface Part Card. Card 1 format used when the MSURF keyword option is active. Provide as many cards as necessary. This input ends at the next keyword ("*") card.

| Card 1a | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |

| VARIABLE | DESCRIPTION |
|----------|---|
| MSURFID | Mesh surface part ID referenced in *MESH_SURFACE_ELE-MENT cards. |
| MSURF_S | Identifier of a set of mesh surface part IDs created with a *LSOID_SET card, where each mesh surface part ID in the set is referenced in *MESH_SURFACE_ELEMENT cards. |
| SSID | Segment set ID |
| N1, N2, | Node IDs defining a segment |

3-30 (CESE) LS-DYNA R12

*CESE_BOUNDARY_SOLID_WALL_OPTION1_OPTION2

For *OPTION1* the choices are:

MSURF

MSURF_SET

SET

SEGMENT

For *OPTION2* the choices are:

<BLANK>

ROTAT

Purpose: Define a solid wall boundary condition (SBC) for this CESE compressible flow solver. This boundary condition can be applied at a solid boundary that is the physical boundary for the flow field. For inviscid flow, this will be a slip boundary condition; while for viscous flows, it is a no-slip boundary condition.

The MSURF and MSURF_SET options are used when the CESE mesh has been created using *MESH cards. The SET and SEGMENT cards are used when *ELEMENT_SOLID cards are used to define the CESE mesh.

Card Sets. The following sequence of cards comprises a *single set*. LS-DYNA will continue reading *CESE_BOUNDARY_SOLID_WALL card sets until the next keyword ("*") card is encountered.

Surface Part Card. Card 1 format used when the MSURF keyword option is active.

| Card 1a | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|---------|------|-----|-----|-----|-----|-----|-----|
| Variable | MSURFID | LCID | Vx | Vy | Vz | Nx | Ny | Nz |
| Туре | I | I | F | F | F | F | F | F |
| Default | none | 0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 |
| Remarks | | 2, 3 | 2 | 2 | 2 | 3 | 3 | 3 |

LS-DYNA R12 3-31 (CESE)

| Surface Part Set Card. | Card 1 format used when the MSURF_SET keyword option is |
|------------------------|---|
| active. | |

| Card 1b | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|---------|------|-----|-----|-----|-----|-----|-----|
| Variable | MSURF_S | LCID | Vx | Vy | Vz | Nx | Ny | Nz |
| Type | I | I | F | F | F | F | F | F |
| Default | none | 0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 |
| Remarks | | 2, 3 | 2 | 2 | 2 | 3 | 3 | 3 |

Set Card. Card 1 format used when the SET keyword option is active.

| Card 1c | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|-----|-----|-----|-----|-----|-----|
| Variable | SSID | LCID | Vx | Vy | Vz | Nx | Ny | Nz |
| Туре | I | I | F | F | F | F | F | F |
| Default | none | 0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 |
| Remarks | | 2, 3 | 2 | 2 | 2 | 3 | 3 | 3 |

Segment Card. Card 1 format used when SEGMENT keyword option is active.

| Card 1d | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|------|------|------|-----|-----|-----|
| Variable | N1 | N2 | N3 | N4 | LCID | Vx | Vy | Vz |
| Туре | I | I | I | I | I | F | F | F |
| Default | none | none | none | none | 0 | 0.0 | 0.0 | 0.0 |
| Remarks | | | | | 2, 3 | 2 | 2 | 2 |

3-32 (CESE) LS-DYNA R12

Rotating Axis Card. Additional card for the "Segment Card" case that is read when the ROTAT keyword option is used.

| Card 2 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-----|-----|-----|---|---|---|---|---|
| Variable | Nx | Ny | Nz | | | | | |
| Type | F | F | F | | | | | |
| Default | 0.0 | 0.0 | 0.0 | | | | | |
| Remarks | 3 | 3 | 3 | | | | | |

| VARIABLE | DESCRIPTION |
|----------|---|
| MSURFID | Mesh surface part ID referenced in *MESH_SURFACE_ELE-MENT cards. |
| MSURF_S | Identifier of a set of mesh surface part IDs created with a *LSOID_SET card, where each mesh surface part ID in the set is referenced in *MESH_SURFACE_ELEMENT cards. |
| SSID | Segment set ID |
| N1, N2, | Node ID's defining a segment |
| LCID | Load curve ID to define this solid wall boundary movement |

If OPTION2 = <BLANK>:

Vx, Vy, Vz velocity vector of the solid wall:

LCID.EQ.0: it is defined by (Vx, Vy, Vz) itself;

LCID.NE.0: it will be defined by both of the load curve and (Vx, Vy, Vz); Nx, Ny, Nz are not used in this case.

If OPTION2 = ROTAT:

Vx, Vy, Vz
 x-,y- & z-coordinates of a point on the rotating axis
 Nx, Ny, Nz
 Unit vector of the rotating axis (for the 2D case, this is not used).
 The rotating frequency (Hz) is given by the load curve.

LS-DYNA R12 3-33 (CESE)

Remarks:

- 1. In this solid-wall condition (SBC), the boundary movement can only be in the tangential direction of the wall and should not affect the fluid domain size and mesh during the calculation, otherwise an FSI or moving mesh solver should be used. Also, this moving SBC only affects viscous flows (no-slip BC).
- 2. If LCID = 0 and Vx = Vy = Vz = 0.0 (default), this will be a regular solid wall BC.
- 3. For rotating SBC, LCID > 0 must be used to define the rotating speed frequency (Hz). Also, in the 2D case, (Nx, Ny, Nz) does not need to be defined because it is not needed.

3-34 (CESE) LS-DYNA R12

*CESE_CHEMISTRY_D3PLOT

Purpose: Cause mass fractions of the listed chemical species to be added to the CESE d3plot output. This is only used when chemistry is being solved with the CESE solver.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|---------|---|---|---|---|---|---|---|
| Variable | MODELID | | | | | | | |
| Туре | I | | | | | | | |
| Default | none | | | | | | | |

Species Cards. Include one card for each species to be included in the d3plot database. This input ends at the next keyword ("*") card.

| Card 2 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | |
|----------|---|---------|---|---|---|---|---|---|--|
| Variable | | SPECIES | | | | | | | |
| Туре | | А | | | | | | | |

| VARIABLE | DESCRIPTION |
|----------|---|
| MODELID | Identifier of a Chemkin-compatible chemistry model. |
| SPECIES | Name of a chemical species that is defined in the chemistry model identified by MODELID (see *CHEMISTRY_MODEL). |

LS-DYNA R12 3-35 (CESE)

*CESE_CONTROL_LIMITER

Purpose: Sets some stability parameters used in the CESE scheme for this CESE compressible flow solver.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|------|------|------|---|---|---|---|
| Variable | IDLMT | ALFA | BETA | EPSR | | | | |
| Туре | I | F | F | F | | | | |
| Default | 0 | 0.0 | 0.0 | 0.0 | | | | |
| Remarks | | 1 | 2 | 3 | | | | |

| VARIABLE | DESCRIPTION |
|----------|--|
| IDLMT | Set the stability limiter option (See CESE theory manual): |
| | EQ.0: limiter format 1 (Re-weighting). |
| | EQ.1: limiter format 2 (Relaxing). |
| ALFA | Re-weighting coefficient (See CESE theory manual) |
| BETA | Numerical viscosity control coefficient (See CESE theory manual) |
| EPSR | Stability control coefficient (See CESE theory manual) |

DESCRIPTION

Remarks:

VADIADIE

- 1. $\alpha \ge 0$; larger values give more stability, but less accuracy. Usually $\alpha = 2.0$ or 4.0 will be enough for normal shock problems.
- 2. $0 \le \beta \le 1$; larger values give more stability. For problems with shock waves, $\beta = 1.0$ is recommended.
- 3. $\varepsilon \ge 0$; larger values give more stability, but less accuracy.

3-36 (CESE) LS-DYNA R12

*CESE_CONTROL_MESH_MOV

Purpose: For moving mesh CESE, this keyword is used to choose the type of algorithm to be used for calculating mesh movement.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|----------|--------|---|---|---|---|---|
| Variable | MMSH | LIM_ITER | RELTOL | | | | | |
| Туре | 1 | I | F | | | | | |
| Default | 1 | 100 | 1.0e-3 | | | | | |

| VARIABLE | DESCRIPTION |
|----------|---|
| MMSH | Mesh motion selector: |
| | EQ.1: mesh moves using an implicit ball-vertex spring method. |
| | EQ.9: the IDW scheme is used to move the mesh. |
| LIM_ITER | Maximum number of linear solver iterations for the ball-vertex linear system. |
| RELTOL | Relative tolerance to use as a stopping criterion for the iterative linear solver (conjugate gradient solver with diagonal scaling preconditioner). |

LS-DYNA R12 3-37 (CESE)

VADIABLE

*CESE_CONTROL_SOLVER

Purpose: Set general purpose control variables for the CESE compressible flow solver.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|-------|-------|--------|-------|------|-------|---|
| Variable | ICESE | IFLOW | IGEOM | IFRAME | MIXID | IDC | ISNAN | |
| Туре | I | I | I | I | I | F | I | |
| Default | 0 | 0 | none | 0 | none | 0.25 | 0 | |
| Remarks | | | 1, 2 | | | 3 | | |

DECODIDATION

| VARIABLE | DESCRIPTION |
|----------|--|
| I CECE | |
| ICESE | Sets the framework of the CESE solver. |

EQ.0: Fixed Eulerian

EQ.100: Moving Mesh FSI

EQ.200: Immersed boundary FSI

IFLOW Sets the compressible flow types:

EQ.0: Viscous flows (laminar)

EQ.1: Invisid flows

IGEOM Sets the geometric dimension:

EQ.2: Two-dimensional (2D) problem

EQ.3: Three-dimensional (3D) problem

EQ.101: 2D axisymmetric

IFRAME Choose the frame of reference:

EQ.0: Usual non-moving reference frame (default).

EQ.1000: Non-inertial rotating reference frame.

MIXID Chemistry model ID that defines the chemical species to include in the mixing model (see *CHEMISTRY_MODEL). The species information is given through the model's card specifying the Chemkin-compatible input.

3-38 (CESE) LS-DYNA R12

| VARIABLE | DESCRIPTION |
|----------|--|
| IDC | Contact interaction detection coefficient (for FSI and conjugate heat transfer problems). |
| ISNAN | Flag to check for a NaN in the CESE solver solution arrays at the completion of each time step. This option can be useful for debugging purposes. There is a cost overhead when this option is active. |
| | EQ.0: No checking, |
| | EQ.1: Checking is active. |

Remarks:

- 1. If the user wants to use the 2D (IGEOM = 2) or 2D axisymmetric (IGEOM = 101) solver, the mesh should only be distributed in the x-y plane with the boundary conditions given only at the x-y domain boundaries. Otherwise, a warning message will be given and the 3D solver will be triggered instead.
- 2. The 2D axisymmetric case will work only if the 2D mesh and corresponding boundary conditions are properly defined, with the *x* and *y* coordinates corresponding to the radial and axial directions respectively.
- 3. IDC is the same type of variable that is input on the *ICFD_CONTROL_FSI card. For an explanation, see Remark 1 for the *ICFD_CONTROL_FSI card.

LS-DYNA R12 3-39 (CESE)

*CESE_CONTROL_TIMESTEP

Purpose: Sets the time-step control parameters for the CESE compressible flow solver.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|-----|------------------|---|---|---|---|---|
| Variable | IDDT | CFL | DTINT | | | | | |
| Туре | I | F | F | | | | | |
| Default | 0 | 0.9 | 10 ⁻³ | | | | | |

| VARIABLE | DESCRIPTION |
|----------|--|
| IDDT | Sets the time step option: |
| | EQ.0: fixed time step size (DTINT, meaning the given initial time step size) |
| | NE.0: the time step size will be calculated based on the given CFL-number and the flow solution at the previous time step. |
| CFL | CFL number (Courant–Friedrichs–Lewy condition) $(0.0 < \text{CFL} \le 1.0)$ |
| DTINT | Initial time step size |

3-40 (CESE) LS-DYNA R12

*CESE_DATABASE_ELOUT

Purpose: This keyword enables the output of CESE data on elements. If more than one element set is defined, then several output files will be generated.

Output Options Card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|-------|---|---|---|---|---|---|
| Variable | OUTLV | DTOUT | | | | | | |
| Туре | I | F | | | | | | |
| Default | 0 | 0. | | | | | | |

Include as many cards as needed. This input ends at the next keyword ("*") card.

| Card 2 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|---|---|---|---|---|---|---|
| Variable | ELSID | | | | | | | |
| Туре | I | | | | | | | |
| Default | none | | | | | | | |

| VARIABLE | DESCRIPTION |
|----------|---|
| OUTLV | Determines if the output file should be dumped. |
| | EQ.0: No output file is generated. |
| | EQ.1: The output file is generated. |
| DTOUT | Time interval to print the output. If DTOUT is equal to 0.0, then the CESE timestep will be used. |
| ELSID | Solid Elements Set ID. |

Remarks:

1. The file name for this database is cese_elout.dat.

LS-DYNA R12 3-41 (CESE)

*CESE_DATABASE_FLUXAVG

Purpose: This keyword enables the output of CESE data on segment sets. If more than one segment set is defined, then several output files will be generated.

Output Options Card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|-------|---|---|---|---|---|---|
| Variable | OUTLV | DTOUT | | | | | | |
| Туре | I | F | | | | | | |
| Default | 0 | 0. | | | | | | |

Include as many cards as needed. This input ends at the next keyword ("*") card.

| Card 2 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|---|---|---|---|---|---|---|
| Variable | SSID | | | | | | | |
| Туре | I | | | | | | | |
| Default | none | | | | | | | |

| VARIABLE | DESCRIPTION |
|----------|---|
| OUTLV | Determines if the output file should be dumped. |
| | EQ.0: No output file is generated. |
| | EQ.1: The output file giving the average fluxes is generated. |
| DTOUT | Time interval to print the output. If DTOUT is equal to 0.0, then the CESE timestep will be used. |
| SSID | Segment Set ID. |

Remarks:

1. The file names for this database is cese_fluxavg.dat.

3-42 (CESE) LS-DYNA R12

*CESE_DATABASE_FSIDRAG

Purpose: This keyword enables the output of the total fluid pressure force applied on solid parts in FSI problems at every time step.

Output Options Card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|---|---|---|---|---|---|---|
| Variable | OUTLV | | | | | | | |
| Туре | I | | | | | | | |
| Default | 0 | | | | | | | |

| VARIABLE | |
|-----------------|--|
|-----------------|--|

DESCRIPTION

OUTLV

Determines if the output file should be dumped.

EQ.0: No output file is generated.

EQ.1: The output file giving the pressure forces is generated.

Remarks:

1. The file names for this database are cese_dragsol.dat, cese_dragshell.dat, cese_dragsol2D.dat and cese_dragbeam.dat .depending on what kind of solid is used.

LS-DYNA R12 3-43 (CESE)

*CESE_DATABASE_POINTOUT

Purpose: This keyword enables the output of CESE data on points.

Output Options Card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|-------|--------|----|----|----|---|---|
| Variable | PSID | DTOUT | PSTYPE | VX | VY | VZ | | |
| Туре | I | F | I | F | F | F | | |
| Default | 0 | 0. | 0 | 0. | 0. | 0. | | |

Include as many cards as needed. This input ends at the next keyword (" \ast ") card.

| Card 2 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|------|------|---|---|---|---|
| Variable | PID | Х | Y | Z | | | | |
| Туре | I | F | F | F | | | | |
| Default | none | none | none | none | | | | |

| VARIABLE | DESCRIPTION |
|------------|---|
| PSID | Point Set ID. |
| DTOUT | Time interval to print the output. If DTOUT is equal to 0.0, then the CESE timestep will be used. |
| PSTYPE | Point Set type : |
| | EQ.0: Fixed points. |
| | EQ.1: Tracer points using prescribed velocity. |
| | EQ.2: Tracer points using fluid velocity. |
| VX, VY, VZ | Constant velocities to be used when PSTYPE = 1 |
| PID | Point ID |
| X, Y, Z | Point initial coordinates |

3-44 (CESE) LS-DYNA R12

Remarks:

1. The file name for this database is cese_pointout.dat.

LS-DYNA R12 3-45 (CESE)

*CESE_DATABASE_SSETDRAG

Purpose: This keyword enables the output of CESE drag forces on segment sets. If more than one segment set is defined, then several output files will be generated.

Output Options Card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|-------|---|---|---|---|---|---|
| Variable | OUTLV | DTOUT | | | | | | |
| Туре | I | F | | | | | | |
| Default | 0 | 0. | | | | | | |

Include as many cards as needed. This input ends at the next keyword ("*") card.

| Card 2 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|---|---|---|---|---|---|---|
| Variable | SSID | | | | | | | |
| Туре | I | | | | | | | |
| Default | none | | | | | | | |

| VARIABLE | DESCRIPTION |
|----------|---|
| OUTLV | Determines if the output file should be dumped. |
| | EQ.0: No output file is generated. |
| | EQ.1: The output file giving the average fluxes is generated. |
| DTOUT | Time interval to print the output. If DTOUT is equal to 0.0, then the CESE timestep will be used. |
| SSID | Segment Set ID. |

Remarks:

1. The file name for this database is *cese_ssetdrag.dat*.

3-46 (CESE) LS-DYNA R12

2. In order for the friction drag to give consistent results, special care must be given to the mesh close to the solid wall boundary (Good capturing of the boundary layer behavior). A very fine structured mesh is recommended.

LS-DYNA R12 3-47 (CESE)

*CESE_DEFINE_NONINERTIAL

Purpose: Define the CESE problem domain as a non-inertial rotating frame that rotates at a constant rate. This is used in rotating problems such as spinning cylinders, wind turbines and turbo machinery.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|------|------|------|------|---|---|
| Variable | FREQ | LCID | PID | Nx | Ny | Nz | | |
| Туре | F | I | I | F | F | F | | |
| Default | none | 0 | none | none | none | none | | |
| | | | | | | | T | |
| Card 2 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| Variable | L | R | RELV | | | | | |
| Туре | F | F | I | | | | | |
| Default | none | none | 0 | | | | | |

| VARIABLE | DESCRIPTION |
|------------|--|
| FREQ | Frequency of rotation. |
| LCID | Load curve ID for scaling factor of FREQ. |
| PID | Starting point ID for the reference frame (See *CESE_DEFINEPOINT). |
| Nx, Ny, Nz | Rotating axis direction. |
| L | Length of rotating frame. |
| R | Radius of rotating frame. |

3-48 (CESE) LS-DYNA R12

| VARIABLE | DESCRIPTION |
|----------|---|
| RELV | Velocity display mode: |
| | EQ.0: Relative velocity, only the non-rotating components of the velocity are output. |
| | EQ.1: Absolute velocity is output. |

LS-DYNA R12 3-49 (CESE)

*CESE_POINT

*CESE_DEFINE_POINT

Purpose: Define points to be used by the CESE solver.

Point Cards. Include one card for each point. This input ends at the next keyword ("*") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|------|------|---|---|---|---|
| Variable | NID | X | Y | Z | | | | |
| Туре | I | F | F | F | | | | |
| Default | none | none | none | none | | | | |

| VARIABLE | DESCRIPTION |
|----------|----------------------------|
| NID | Identifier for this point. |
| X, Y, Z | Coordinates of the point. |

3-50 (CESE) LS-DYNA R12

*CESE_DRAG *CESE

*CESE_DRAG

Purpose: Provide the far-field (or free-stream) fluid pressure.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|---|---|---|---|---|---|---|
| Variable | PRESS | | | | | | | |
| Туре | F | | | | | | | |

| VARIABLE | DESCRIPTION |
|----------|---|
| PRESS | Value of the free-stream fluid pressure (in units used by the current problem). |

LS-DYNA R12 3-51 (CESE)

*CESE_EOS_CAV_HOMOG_EQUILIB

Purpose: Define the coefficients in the equation of state (EOS) for the homogeneous equilibrium cavitation model.

Include as many cards as needed. This input ends at the next keyword ("*") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|---------------------|-------------|--------------|-----------|-------------------|--------------|--------------|
| Variable | EOSID | $ ho_{	extsf{vap}}$ | $ ho_{liq}$ | $a_{ m vap}$ | a_{liq} | $\mu_{	ext{vap}}$ | μ_{liq} | P_{SatVap} |
| Туре | I | F | F | F | F | F | F | F |
| Default | none | 0.8 | 880.0 | 334.0 | 1386.0 | 1.435e- 5 | 1.586e- 4 | 1.2e+4 |

| VARIABLE | DESCRIPTION |
|--------------------|-------------------------------------|
| EOSID | Equation of state identifier |
| $ ho_{ m vap}$ | density of the saturated vapor |
| $ ho_{ m liq}$ | density of the saturated liquid |
| a_{vap} | sound speed of the saturated vapor |
| $a_{ m liq}$ | sound speed of the saturated liquid |
| $\mu_{ m vap}$ | dynamic viscosity of the vapor |
| $\mu_{ m liq}$ | dynamic viscosity of the liquid |
| P_{SatVap} | pressure of the saturated vapor |

Remarks:

- 1. Once a cavitation EOS is used, the cavitation flow solver will be triggered.
- 2. In this homogeneous equilibrium cavitation model, a barotropic equation of state is used. This model can be used in small scale & high speed cavitation flows, and it is not good for large-scale, low-speed cavitation calculations.

3-52 (CESE) LS-DYNA R12

*CESE_EOS_IDEAL_GAS

Purpose: Define the coefficients Cv and Cp in the equation of state for an ideal gas in the CESE fluid solver.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|-------|--------|---|---|---|---|---|
| Variable | EOSID | Cv | Ср | | | | | |
| Туре | I | F | F | | | | | |
| Default | none | 717.5 | 1004.5 | | | | | |

| VARIABLE | DESCRIPTION |
|----------|------------------------------------|
| EOSID | Equation of state identifier |
| Cv | Specific heat at constant volume |
| Ср | Specific heat at constant pressure |

Remarks:

1. **Units.** As with other solvers in LS-DYNA, the user is responsible for unit consistency. For example, if a user wants to use dimensionless variables, Cv and Cp should also be replaced by the corresponding dimensionless ones.

LS-DYNA R12 3-53 (CESE)

*CESE_EOS_INFLATOR1

Purpose: To define an EOS using Cp and Cv thermodynamic expansions for an inflator gas mixture with a single temperature range.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|---|---|---|---|---|---|---|
| Variable | EOSID | | | | | | | |
| Туре | I | | | | | | | |
| Default | none | | | | | | | |

| Card 2 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-----|-----|-----|-----|-----|---|---|---|
| Variable | Cp0 | Cp1 | Cp2 | СрЗ | Cp4 | | | |
| Туре | F | F | F | F | F | | | |
| Default | 0. | 0. | 0. | 0. | 0. | | | |

| Card 3 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-----|-----|-----|-----|-----|---|---|---|
| Variable | Cv0 | Cv1 | Cv2 | Cv3 | Cv4 | | | |
| Туре | F | F | F | F | F | | | |
| Default | 0. | 0. | 0. | 0. | 0. | | | |

VARIABLEDESCRIPTIONEOSIDEquation of state identifier for the CESE solver.Cp0, ..., Cp4Coefficients of temperature-dependent specific heat at constant pressure
 $C_p(T) = C_{p0} + C_{p1} T + C_{p2} T^2 + C_{p3} T^3 + C_{p4} T^4$

| VARIABLE | DESCRIPTION |
|-----------|--|
| Cv0,, Cv4 | Coefficients of temperature-dependent specific heat at constant volume |
| | $C_v(T) = C_{v0} + C_{v1} T + C_{v2} T^2 + C_{v3} T^3 + C_{v4} T^4$ |

Remark:

1.These coefficient expansions for the specific heats over the entire temperature range are generated by the 0-D inflator model solver. See *CHEMISTRY_CONTROL_INFLATOR and *CHEMISTRY_INFLATOR_PROPERTIES for details related to running that solver.

LS-DYNA R12 3-55 (CESE)

*CESE_EOS_INFLATOR2

Purpose: To define an EOS using Cp and Cv thermodynamic expansions for an inflator gas mixture with two temperature ranges, one below 1000 degrees Kelvin, and the other above 1000 degrees Kelvin.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|---|---|---|---|---|---|---|
| Variable | EOSID | | | | | | | |
| Туре | I | | | | | | | |
| Default | none | | | | | | | |

Card for the expansion of Specific Heat at Constant Pressure. Valid for T < $1000~^{\circ}$ K

| Card 2 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|-------|-------|-------|-------|---|---|---|
| Variable | Cp1_0 | Cp1_1 | Cp1_2 | Cp1_3 | Cp1_4 | | | |
| Туре | F | F | F | F | F | | | |
| Default | 0. | 0. | 0. | 0. | 0. | | | |

Card for the expansion of Specific Heat at Constant Pressure. Valid for T > 1000 0 K.

| Card 3 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|-------|-------|-------|-------|---|---|---|
| Variable | Cp2_0 | Cp2_1 | Cp2_2 | Cp2_3 | Cp2_4 | | | |
| Туре | F | F | F | F | F | | | |
| Default | 0. | 0. | 0. | 0. | 0. | | | |

3-56 (CESE) LS-DYNA R12

Card for the expansion of Specific Heat at Constant Volume. Valid for T < 1000 0 K

| Card 4 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|-------|-------|-------|-------|---|---|---|
| Variable | Cv1_0 | Cv1_1 | Cv1_2 | Cv1_3 | Cv1_4 | | | |
| Туре | F | F | F | F | F | | | |
| Default | 0. | 0. | 0. | 0. | 0. | | | |

Card for the expansion of Specific Heat at Constant Volume. Valid for T > $1000~^{\circ}$ K.

| Card 5 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|-------|-------|-------|-------|---|---|---|
| Variable | Cv2_0 | Cv2_1 | Cv2_2 | Cv2_3 | Cv2_4 | | | |
| Туре | F | F | F | F | F | | | |
| Default | 0. | 0. | 0. | 0. | 0. | | | |

| VARIABLE | DESCRIPTION |
|------------------|---|
| EOSID | Equation of state identifier for the CESE solver. |
| Cp1_0,, Cp1_4 | Coefficients of temperature-dependent specific heat at constant pressure valid for T < 1000 $^{\rm 0}$ K. |
| | $C_{p1}(T) = C_{p1_0} + C_{p1_1} T + C_{p1_2} T^2 + C_{p1_3} T^3 + C_{p1_4} T^4$ |
| Cp2_0,, Cp2_4 | Coefficients of temperature-dependent specific heat at constant pressure valid for T > $1000~^{\rm o}$ K. |
| | $C_{p2}(T) = C_{p2_0} + C_{p2_1} T + C_{p2_2} T^2 + C_{p2_3} T^3 + C_{p2_4} T^4$ |
| Cv1_0,, Cv1_4 | Coefficients of temperature-dependent specific heat at constant volume valid for T < 1000 $^{\rm o}$ K. |
| | $C_{v1}(T) = C_{v1_0} + C_{v1_1} T + C_{v1_2} T^2 + C_{v1_3} T^3 + C_{v1_4} T^4$ |
| Cv2_0,, Cv2_4 | Coefficients of temperature-dependent specific heat at constant volume valid for T > $1000~^{\rm o}$ K. |
| | $C_{v2}(T) = C_{v2_0} + C_{v2_1} T + C_{v2_2} T^2 + C_{v2_3} T^3 + C_{v2_4} T^4$ |

Remark:

2.These coefficient expansions for the specific heats over two temperature ranges are generated by the 0-D inflator model solver. See *CHEMISTRY_CONTROL_IN-FLATOR and *CHEMISTRY_INFLATOR_PROPERTIES for details related to running that solver.

3-58 (CESE) LS-DYNA R12

*CESE

*CESE_FSI_EXCLUDE

Purpose: Provide a list of mechanics solver parts that are not involve in the CESE FSI calculation. This is intended to be used as an efficiency measure for parts that will not involve significant FSI interactions with the CESE compressible fluid solver..

Include as many cards as needed. This input ends at the next keyword ("*") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|------|------|------|------|------|------|
| Variable | PID1 | PID2 | PID3 | PID4 | PID5 | PID6 | PID7 | PID8 |
| Туре | I | I | I | I | I | I | I | I |
| Default | none |

| VARIABLE | DESCRIPTION |
|----------|---|
| PIDn | IDs of mechanics parts that will be excluded from the FSI |
| | interaction calculation with the CESE solver. |

LS-DYNA R12 3-59 (CESE)

*CESE_INITIAL

*CESE_INITIAL

Purpose: Specify constant initial conditions (ICs) for flow variables at the centroid of each fluid element.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|---|-----|-----|-------|-----|-----|---|---|
| Variable | U | V | W | RH | Р | Т | | |
| Type | F | F | F | F | F | F | | |
| Default | 0 | 0.0 | 0.0 | 1.225 | 0.0 | 0.0 | | |

| VARIABLE | DESCRIPTION | _ |
|----------|---|---|
| U, V, W | <i>x-</i> , <i>y-</i> , <i>z-</i> velocity components, respectively | |
| RHO | Density, ρ | |
| P | Pressure, P | |
| T | Temperature, T | |

Remarks:

- 1. **Required Input.** Usually, only two of ρ , P, and T need to be specified (besides the velocity). If all three are given, only ρ and P will be used.
- 2. **Applicable Elements.** These initial conditions will be applied only in those elements that have not been assigned a value by *CESE_INITIAL_OPTION cards for individual elements or sets of elements.

3-60 (CESE) LS-DYNA R12

*CESE_INITIAL *CESE

*CESE_INITIAL_OPTION

Available options include:

SET

ELEMENT

Purpose: Specify initial conditions for the flow variables at the centroid of each element in a set of elements or at the centroid of a single element.

Include as many cards as needed. This input ends at the next keyword ("*") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|----------|-----|-----|-----|-------|-----|-----|---|
| Variable | EID/ESID | U | V | W | RH0 | Р | Т | |
| Туре | I | F | F | F | F | F | F | |
| Default | none | 0.0 | 0.0 | 0.0 | 1.225 | 0.0 | 0.0 | |
| Remarks | | | | | 1 | 1 | 1 | |

| VARIABLE | DESCRIPTION |
|----------|---|
| EID/ESID | Solid element ID (EID) or solid element set ID (ESID) |
| U, V, W | <i>x-, y-, z-</i> velocity components, respectively |
| RHO | Density, ρ |
| P | Pressure, P |
| T | Temperature, T |

Remarks:

- 1. **Required Input.** Usually, only two of ρ , P, and T need to be specified (along with the velocity). If all three are given, only ρ and P will be used.
- 2. **Initial Condition Specification Priority.** The priority of this card is higher than *CESE_INITIAL, meaning that if an element is assigned an initial value by this card, *CESE_INITIAL will no longer apply to that element.

LS-DYNA R12 3-61 (CESE)

*CESE_INITIAL_CHEMISTRY

Purpose: Initializes the chemistry and fluid state in every element of the CESE mesh that has not already been initialized by one of the other *CESE_INITIAL_CHEMISTRY cards. This is only used when chemistry is being solved with the CESE solver.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|--------|--------|------|-------|------|------|------|---|
| Variable | CHEMID | COMPID | | | | | | |
| Туре | I | I | | | | | | |
| Default | none | none | | | | | | |
| | | | | | | | | |
| Card 2 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| Variable | UIC | VIC | WIC | RHOIC | PIC | TIC | HIC | |
| Туре | F | F | F | F | F | F | F | |
| Default | none | none | none | none | none | none | none | |

| VARIABLE | DESCRIPTION |
|----------|---|
| CHEMID | Identifier of chemistry control card to use |
| COMPID | Identifier of chemical composition to use |
| UIC | X-component of the fluid velocity |
| VIC | Y-component of the fluid velocity |
| WIC | Z-component of the fluid velocity |
| RHOIC | Initial fluid density |
| PIC | Initial fluid pressure |
| TIC | Initial fluid temperature |
| | |

3-62 (CESE) LS-DYNA R12

| VARIABLE | DESCRIPTION |
|----------|---|
| HIC | Initial fluid enthalpy. However, when CHEMID refers to a ZND 1-step reaction card, this is the progressive variable (degree of combustion). |

LS-DYNA R12 3-63 (CESE)

*CESE_INITIAL_CHEMISTRY_ELEMENT

Purpose: Initializes the chemistry and fluid state in every element of the list of CESE elements. This is only used when chemistry is being solved with the CESE solver.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|--------|--------|------|-------|------|------|------|---|
| Variable | CHEMID | COMPID | | | | | | |
| Туре | I | I | | | | | | |
| Default | none | none | | | | | | |
| | | | | | | | T | T |
| Card 2 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| Variable | UIC | VIC | WIC | RHOIC | PIC | TIC | HIC | |
| Туре | F | F | F | F | F | F | F | |
| Default | none | none | none | none | none | none | none | |

Element List Card. Include as many cards as necessary. This input ends at the next keyword ("*") card.

| Card 3 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|------|------|------|------|------|------|
| Variable | ELE1 | ELE2 | ELE3 | ELE4 | ELE5 | ELE6 | ELE7 | ELE8 |
| Туре | I | I | I | I | I | I | I | I |

| VARIABLE | DESCRIPTION |
|----------|---|
| CHEMID | Identifier of chemistry control card to use |
| COMPID | Identifier of chemical composition to use |
| UIC | X-component of the fluid velocity |
| VIC | Y-component of the fluid velocity |
| | |

3-64 (CESE) LS-DYNA R12

| VARIABLE | DESCRIPTION |
|--------------|---|
| WIC | Z-component of the fluid velocity |
| RHOIC | Initial fluid density |
| PIC | Initial fluid pressure |
| TIC | Initial fluid temperature |
| HIC | Initial fluid enthalpy. However, when CHEMID refers to a ZND 1-step reaction card, this is the progressive variable (degree of combustion). |
| ELE <i>i</i> | User element numbers to initialize |

LS-DYNA R12 3-65 (CESE)

*CESE_INITIAL_CHEMISTRY_PART

Purpose: Initializes the chemistry and fluid state in every element of the specified CESE part that has not already been initialized by *CESE_INITIAL_CHEMISTRY_ELEMENT or *CESE_INITIAL_CHEMISTRY_SET cards. This is only used when chemistry is being solved with the CESE solver.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|--------|--------|--------|-------|------|------|------|---|
| Variable | PARTID | CHEMID | COMPID | | | | | |

| VARIABLE | DESCRIPTION |
|----------|---|
| PARTID | Identifier of the CESE part on which to initialize. |
| CHEMID | Identifier of chemistry control card to use. |
| COMPID | Identifier of chemical composition to use. |
| UIC | X-component of the fluid velocity. |
| VIC | Y-component of the fluid velocity. |
| WIC | Z-component of the fluid velocity. |
| RHOIC | Initial fluid density. |
| PIC | Initial fluid pressure. |
| TIC | Initial fluid temperature. |
| | |

3-66 (CESE) LS-DYNA R12

| VARIABLE | DESCRIPTION |
|----------|---|
| HIC | Initial fluid enthalpy. However, when CHEMID refers to a ZND 1-step reaction card, this is the progressive variable (degree of combustion). |

LS-DYNA R12 3-67 (CESE)

*CESE_INITIAL_CHEMISTRY_SET

Purpose: Initializes the chemistry and fluid state in every element of the specified element set in the CESE mesh that has not already been initialized by *CESE_INITIAL_-CHEMISTRY_ELEMENT cards. This is only used when chemistry is being solved with the CESE solver.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|--------|--------|-------|------|------|------|---|
| Variable | SETID | CHEMID | COMPID | | | | | |
| Туре | I | I | I | | | | | |

| Variable | UIC | VIC | WIC | RHOIC | PIC | TIC | HIC | |
| Туре | F | F | F | F | F | F | F | |
| Default | none | none | none | none | none | none | none | |

| VARIABLE | DESCRIPTION |
|----------|---|
| SETID | Identifier of the CESE element set to initialize. |
| CHEMID | Identifier of chemistry control card to use. |
| COMPID | Identifier of chemical composition to use. |
| UIC | X-component of the fluid velocity. |
| VIC | Y-component of the fluid velocity. |
| WIC | Z-component of the fluid velocity. |
| RHOIC | Initial fluid density. |
| PIC | Initial fluid pressure. |
| TIC | Initial fluid temperature. |
| | |

3-68 (CESE) LS-DYNA R12

| VARIABLE | DESCRIPTION |
|----------|---|
| HIC | Initial fluid enthalpy. However, when CHEMID refers to a ZND 1-step reaction card, this is the progressive variable (degree of combustion). |

LS-DYNA R12 3-69 (CESE)

*CESE_MAT_000

Purpose: Define the fluid (gas) properties in a viscous flow for the CESE solver.

Material Definition Cards. Include one card for each instance of this material type. This input ends at the next keyword ("*") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|------|---|---|---|---|---|
| Variable | MID | MU | К | | | | | |
| Туре | I | F | F | | | | | |
| Default | none | none | none | | | | | |

| VARIABLE | DESCRIPTION | | | | | | | |
|----------|---|--|--|--|--|--|--|--|
| MID | Material identifier | | | | | | | |
| MU | Fluid dynamic viscosity. For Air at 15 °C, MU = 1.81×10^{-5} kg/ms | | | | | | | |
| K | Thermal conductivity of the fluid | | | | | | | |

Remarks:

- 1. The viscosity is only used viscous flows, so for inviscid flows, it is not necessary to define it. The thermal conductivity is only used to calculate the heat transfer between the structure and the thermal solver when coupling is activated.
- 2. As with other solvers in LS-DYNA, the user is responsible for unit consistency. For example, if dimensionless variables are used, MU should be replaced by the corresponding dimensionless one.

3-70 (CESE) LS-DYNA R12

*CESE_MAT_001(_GAS)

Purpose: Define the fluid (gas) properties in a viscous flow for the CESE solver.

Include as many cards as needed. This input ends at the next keyword ("*") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|--------------|-------|------|---|---|---|---|
| Variable | MID | C1 | C2 | PRND | | | | |
| Туре | I | F | F | F | | | | |
| Default | none | 1.458E- 6 | 110.4 | 0.72 | | | | |

VARIABLE

DESCRIPTION

MID

Material identifier

C1, C2

Two coefficients in the Sutherland's formula for viscosity, i.e.,

$$\mu = \frac{C_1 T^{\frac{3}{2}}}{T + C_2}$$

where C_1 and C_2 are constants for a given gas. For example, for air at moderate temperatures,

$$C_1 = 1.458 \times 10^{-6} \text{ kg/msK}^{1/2}, \quad C_2 = 110.4 \text{ K}$$

PRND

The Prandtl Number (used to determine the coefficient of thermal conductivity). It is approximately constant for most gases. For air at standard conditions PRND = 0.72.

Remarks:

- 1. C1 and C2 are only used to calculate the viscosity in viscous flows, so for inviscid flows, this material card is not needed. The Prandtl number is used to extract the thermal conductivity, which is used when thermal coupling with the structure is activated.
- 2. As with other solvers in LS-DYNA, the user is responsible for unit consistency. For example, if dimensionless variables are used, C_1 and C_2 should be replaced by the corresponding dimensionless ones.

LS-DYNA R12 3-71 (CESE)

*CESE_MAT_002

Purpose: Define the fluid (gas) properties in a viscous flow for the CESE solver.

Material Definition Cards. Include one card for each instance of this material type. This input ends at the next keyword ("*") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|----------|------|--------|-------|-------|---|---|
| Variable | MID | MU0 | SMU | K0 | SK | T0 | | |
| Туре | I | F | F | F | F | F | | |
| Default | none | 1.716E-5 | 111. | 0.0241 | 194.0 | 273.0 | | |

VARIABLE

DESCRIPTION

MID

Material identifier

MU0 / SMU

Two coefficients appearing in the equation derived by combining Sutherland's formula with the power law for dilute gases:

$$\frac{\mu}{\mu_0} = \left(\frac{T}{T_0}\right)^{3/2} \frac{T_0 + S_{\mu}}{T + S_{\mu}} \ .$$

 μ_0 is a reference value, and S_μ is an effective temperature called the Sutherland constant, which is characteristic of the gas. For air at moderate temperatures,

$$\mu_0 = 1.716 \times 10^{-5} \,\text{Ns/m}^2$$
, $S_\mu = 111 \,\text{K}$

K0/SK

Two coefficients appearing in the equation derived by combining Sutherland's formula with the power law for dilute gases:

$$\frac{k}{k_0} = \left(\frac{T}{T_0}\right)^{3/2} \frac{T_0 + S_k}{T + S_k} \ .$$

Here k is the thermal conductivity, k_0 is a reference value, and S_k is the Sutherland constant, which is characteristic of the gas. For air at moderate temperatures,

$$k_0 = 0.0241 \,\, \mathrm{W/m} \,, \qquad S_k = 194 \,\, \mathrm{K}$$

To Reference temperature, T_0 . The default value (273.0) is for air, in degrees K.

*CESE_MAT_002 *CESE

Remarks:

1. **Fields that Depend on Problem Physics.** The viscosity is only used for viscous flow. Therefore, for inviscid flows, it is not necessary to define it. The thermal conductivity is only used to calculate the heat transfer between the structure and the thermal solver when coupling is activated.

2. **Unit Consistency.** As with other solvers in LS-DYNA, the user is responsible for unit consistency. For example, if dimensionless variables are used, MU should be replaced by the corresponding dimensionless one.

LS-DYNA R12 3-73 (CESE)

*CESE_PART

*CESE_PART

Purpose: Define CESE solver parts, i.e., connect CESE material and EOS information.

Part Cards. Include one card for each CESE part. This input ends at the next keyword ("*") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|-------|---|---|---|---|---|
| Variable | PID | MID | EOSID | | | | | |
| Туре | I | I | I | | | | | |
| Default | none | none | none | | | | | |

| VARIABLE | DESCRIPTION |
|----------|--|
| PID | Part identifier (must be different from any PID on a *PART card) |
| MID | Material identifier defined by a *CESE_MAT card |
| EOSID | Equation of state identifier defined by a *CESE_EOS card |

Remarks:

1. Since material coefficients are only used in viscous flows, the MID can be left blank for inviscid flows.

3-74 (CESE) LS-DYNA R12

*CESE_SURFACE_MECHSSID_D3PLOT

Purpose: Identify the surfaces to be used in generating surface D3PLOT output for the CESE solver. These surfaces must be on the outside of volume element parts that are in contact with the CESE fluid mesh. The variables in question are part of the CESE FSI solution process or of the CESE conjugate heat transfer solver.

Include as many cards as needed. This input ends at the next keyword ("*") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | |
|----------|------|--------------|---|---|---|---|---|---|--|
| Variable | SSID | SurfaceLabel | | | | | | | |
| Туре | I | | А | | | | | | |
| Default | none | none | | | | | | | |

| VARIABLE | DESCRIPTION | | | | | |
|--------------|--|--|--|--|--|--|
| SSID | Mechanics solver segment set ID that is in contact with the fluid CESE mesh. | | | | | |
| SurfaceLabel | Name to use in d3plot output to identify the SSID for the LSPP user. | | | | | |

LS-DYNA R12 3-75 (CESE)

*CESE_SURFACE_MECHVARS_D3PLOT

Purpose: List of variables to output on the surfaces designated by the segment set IDs given in the *CESE_SURFACE_MECHSSID_D3PLOT cards. Most of the allowed variables are defined only on the fluid-structure interface, and so the segment set IDs defining a portion of the fluid-structure interface must involve only segments (element faces) that are on the outside of volume element parts that are in contact with the CESE fluid mesh.

Include as many cards as needed. This input ends at the next keyword ("*") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | |
|----------|-----------------|---|---|---|---|---|---|---|--|
| Variable | Output Quantity | | | | | | | | |
| Туре | | А | | | | | | | |
| Default | none | | | | | | | | |

| VARIABLE | DESCRIPTION |
|----------|-------------|
| | |

3-76 (CESE) LS-DYNA R12

VARIABLE

Output Quantity

Descriptive phrase for the mechanics surface variable to output for the LSPP user. Output will be done on all SSIDs selected by the *CESE_SURFACE_MECHSSID_D3PLOT cards in the problem.

DESCRIPTION

Supported variables include:

FLUID FSI FORCE
FLUID FSI PRESSURE
INTERFACE TEMPERATURE
SOLID INTERFACE HEAT FLUX
FLUID INTERFACE HEAT FLUX
INTERFACE HEAT FLUX RATE
SOLID INTERFACE DISPLACEMENT
SOLID INTERFACE VELOCITY
SOLID INTERFACE ACCELERATION

Force, displacement, velocity, and acceleration are output as vector quantities. The rest of the variables are scalar quantities. The fluxes are in the normal direction to the fluid/structure interface, with the heat fluxes relative to the normal pointing into the structure.

LS-DYNA R12 3-77 (CESE)

*CHEMISTRY

The keyword *CHEMISTRY is used to access chemistry databases that include Chemkin-based descriptions of a chemical model, as well as to select a method of solving the model. The keyword cards in this section are defined in alphabetical order:

- *CHEMISTRY_BLAST_INITIATION
- *CHEMISTRY COMPOSITION
- *CHEMISTRY_CONTROL_0D
- *CHEMISTRY_CONTROL_1D[†]
- *CHEMISTRY CONTROL CSP
- *CHEMISTRY_CONTROL_FULL
- *CHEMISTRY_CONTROL_INFLATOR[†]
- *CHEMISTRY_CONTROL_TBX
- *CHEMISTRY_CONTROL_ZND[†]
- *CHEMISTRY_DET_INITIATION[†]
- *CHEMISTRY_INFLATOR_PROPERTIES[†]
- *CHEMISTRY_MODEL
- *CHEMISTRY_PATH

†: Card may be used only once in a given model

An additional option "_TITLE" may be appended to all *CHEMISTRY keywords. If this option is used, then an 80 character string is read as a title from the first card of that keyword's input. At present, LS-DYNA does not make use of the title. Inclusion of titles gives greater clarity to input decks.

In order to use one of the chemistry solvers, the input must include at least one *CHEM-ISTRY_MODEL card. For each spatial region containing a different chemical composition, at least one *CHEMISTRY_COMPOSITION card is required.

LS-DYNA R12 4-1 (CHEMISTRY)

*CHEMISTRY

The *CHEMISTRY_CONTROL_0D card is intended to be used in a standalone fashion to verify the validity of a given chemistry model. This model includes the total number of species and all elementary reactions with their Arrhenius rate parameters. For instance, this solver could be used to check the induction time of the model.

The *CHEMISTRY_BLAST_INITIATION, *CHEMISTRY_CONTROL_1D, *CHEMISTRY_DET_INITIATION, and *CHEMISTRY_CONTROL_ZND cards are intended to provide a one-dimensional initialization to a 2D or 3D chemically-reacting flow.

In order to perform a full, general purpose chemistry calculation in 2D or 3D, the *CHEMISTRY_CONTROL_FULL card should be used.

The *CHEMISTRY_CONTROL_CSP card is an option for reducing the number of species and reactions that are used in a general purpose chemistry calculation. Other reduction mechanisms are planned for the future.

An airbag inflator model is available with *CHEMISTRY_CONTROL_INFLATOR along with *CHEMISTRY_INFLATOR_PROPERTIES and a chemistry model that is referenced via three chemical compositions. This involves zero-dimensional modeling, with pyrotechnic inflator, and cold and hot flow hybrid inflator options.

The *CHEMISTRY_CONTROL_TBX card is intended for use only in a stochastic particle model, where the *STOCHASTIC_TBX_PARTICLES card is used.

4-2 (CHEMISTRY)
LS-DYNA R12

*CHEMISTRY_COMPOSITION

Purpose: Provides a general way to specify a chemical composition via a list of species mole numbers in the context of a Chemkin database model.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|---------|---|---|---|---|---|---|
| Variable | ID | MODELID | | | | | | |
| Туре | I | I | | | | | | |
| Default | none | none | | | | | | |

Species List Card. Provide as many cards as necessary. This input ends at the next keyword ("*") card.

| Card 2 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|---|---|---|---------|---|---|---|
| Variable | MOLFR | | | | SPECIES | | | |
| Туре | F | | | | Α | | | |
| Default | none | | | | none | | | |

| VARIABLE | DESCRIPTION |
|----------|--|
| ID | A unique identifier among all chemistry compositions. |
| MODELID | Identifier of a Chemkin-compatible chemistry model. |
| MOLFR | The number of moles corresponding to the species named in the SPECIES field. But if used with a *STOCHASTIC_TBX_PARTICLES card, it is the molar concentration of the species (in units of moles/[length] ³ , where "[length]" is the user's length unit). |
| SPECIES | The Chemkin-compatible name of a chemical species that is defined in the chemistry model identified by MODELID (see *CHEMISTRY_MODEL). |

LS-DYNA R12 4-3 (CHEMISTRY)

*CHEMISTRY_CONTROL_0D

Purpose: Performs a zero-dimensional isotropic chemistry calculation that operates standalone (does not call the CESE solver). This is for ISOBARIC or ISOCHORIC cases.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |

VARIABLE DESCRIPTION

ID Identifier for this 0D computation.

4-4 (CHEMISTRY) LS-DYNA R12

| VARIABLE | DESCRIPTION |
|----------|--|
| COMPID | Chemical composition identifier of composition to use. |
| SOLTYP | Type of 0D calculation: |
| | EQ.1: Isochoric |
| | EQ.2: Isobaric |
| PLOTDT | Simulation time interval for output both to the screen and to the isocom.csv file. This file can be loaded into LS-PREPOST for curve plotting using the x-y plot facility. |
| CSP_SEL | CSP solver option: |
| | EQ.0: Do not use the CSP solver, and ignore the AMPL and YCUT parameters (default). |
| | GT.0: Use the CSP solver, with the AMPL and YCUT parameters. |
| DT | Initial time step |
| TLIMIT | Time limit for the simulation |
| TIC | Initial temperature |
| PIC | Initial pressure |
| RIC | Initial density |
| EIC | Initial internal energy |
| AMPL | Relative accuracy for the mass fraction of a chemical species in the Chemkin input file. |
| YCUT | Absolute accuracy for the mass fraction of a chemical species in the Chemkin input file. |

Remarks:

1. If CSP_SEL.GT.0, then instead of using the full chemistry solver, the computational singular perturbation (CSP) method solver is used.

LS-DYNA R12 4-5 (CHEMISTRY)

*CHEMISTRY_CONTROL_1D

Purpose: Loads a previously-computed one-dimensional detonation. It is then available for use in the CESE solver for initializing a computation. In the product regions, this card overrides the initialization of the *CESE_INITIAL_CHEMISTRY_... cards.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|--------|---------|---|---|---|---|
| Variable | ID | XYZD | DETDIR | CSP_SEL | | | | |
| Туре | I | F | I | I | | | | |
| Default | none | none | none | 0 | | | | |
| Remarks | | | | 1 | | | | |

One-Dimensional Solution LSDA Input File Card.

| Card 2 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|---|---|---|-----|----|---|---|---|
| Variable | | | | FII | LE | | | |
| Туре | | | | ļ | Ą | | | |

CSP Parameters Card Include cards for each chemical species in the following format when $CSP_SEL > 0$. This input ends at the next keyword ("*") card.

| Card 3 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|---|---|---|---|---|---|
| Variable | AMPL | YCUT | | | | | | |
| Туре | F | F | | | | | | |
| Default | none | none | | | | | | |

| VARIABLE | DESCRIPTION |
|----------|---|
| ID | Identifier for this one-dimensional detonation solution |

4-6 (CHEMISTRY) LS-DYNA R12

| VARIABLE | DESCRIPTION |
|----------|--|
| XYZD | Position of the detonation front in the DETDIR direction. |
| DETDIR | Detonation propagation direction |
| | EQ.1: x |
| | EQ.2: <i>y</i> |
| | EQ.3: z |
| CSP_SEL | CSP solver option: |
| | EQ.0: Do not use the CSP solver, and ignore the AMPL and YCUT parameters (default). |
| | GT.0: Use the CSP solver, with the AMPL and YCUT parameters. |
| FILE | Name of the LSDA file containing the one-dimensional solution. |
| AMPL | Relative accuracy for the mass fraction of a chemical species in the chemkin input file. |
| YCUT | Absolute accuracy for the mass fraction of a chemical species in the chemkin input file. |

Remarks:

1. If CSP_SEL > 0, then instead of using the full chemistry solver, the computational singular perturbation (CSP) method solver is used.

LS-DYNA R12 4-7 (CHEMISTRY)

*CHEMISTRY_CONTROL_CSP

Purpose: Computes reduced chemistry for a specified Chemkin chemistry model using the Computational Singular Perturbation (CSP) method. This card can be used for general-purpose chemical reaction calculations.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|---------|---|---|---|---|---|---|
| Variable | ID | IERROPT | | | | | | |
| Туре | I | I | | | | | | |
| Default | none | none | | | | | | |

CSP Parameters Card. Include cards for each chemical species in the following format as indicated by the value of IERROPT. This input ends at the next keyword ("*") card.

| Card 2 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|---|---|---|---|---|---|
| Variable | AMPL | YCUT | | | | | | |
| Туре | F | F | | | | | | |
| Default | none | none | | | | | | |

| VARIABLE | DESCRIPTION |
|----------|--|
| ID | Identifier for this computational singular perturbation solver. |
| IERROPT | Selector: |
| | EQ.0: AMPL and YCUT values for all chemical species are required. |
| | EQ.1: One CSP Parameter Card should be provided, and it will be used for all species. |
| AMPL | Relative accuracy for the mass fraction of a chemical species in the Chemkin input file. |
| YCUT | Absolute accuracy for the mass fraction of a chemical species in the Chemkin input file. |

4-8 (CHEMISTRY) LS-DYNA R12

*CHEMISTRY_CONTROL_FULL

Purpose: Computes the full chemistry specified by a Chemkin chemistry model. This card can be used for general-purpose chemical reaction calculations.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|--------|--------|------|---|---|---|---|
| Variable | ID | ERRLIM | RHOMIN | TMIN | | | | |
| Туре | 1 | F | F | F | | | | |
| Default | none | none | 0.0 | 0.0 | | | | |

| VARIABLE | DESCRIPTION |
|----------|--|
| ID | Identifier for this full chemistry calculation. |
| ERRLIM | Error tolerance for the full chemistry calculation. |
| RHOMIN | Minimum fluid density above which chemical reactions are computed. |
| TMIN | Minimum temperature above which chemical reactions are computed. |

LS-DYNA R12 4-9 (CHEMISTRY)

*CHEMISTRY_CONTROL_INFLATOR

Purpose: Provide the required properties of an inflator model for airbag inflation.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|----------|---------|------|-------|---|---|---|
| Variable | MODEL | OUT_TYPE | TRUNTIM | DELT | PTIME | | | |
| Туре | I | I | F | F | F | | | |
| Remarks | 1 | 2,4 | | | | | | |

Inflator Output Database File (an ASCII file) Card.

| Card 2 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|---|---|---|-----|----|---|---|---|
| Variable | | | | FII | LE | | | |
| Туре | | | | ļ | 4 | | | |

Densities for Condensed Species. Include as many cards as needed. This input ends at the next keyword ("*") card.

| Card 3 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|---------|---|---|---|------------|---|---|---|
| Variable | DENSITY | | | S | pecies Nam | е | | |
| Туре | F | | | | Α | | | |
| Default | none | | | | none | | | |
| Remark | | | | | 3 | | | |

VARIABLE DESCRIPTION

4-10 (CHEMISTRY) LS-DYNA R12

| VARIABLE | | DESCRIPTION |
|-----------------|-------------------------|--|
| MODEL | Type of infla | tor model to compute. |
| | EQ.1: | Pyrotechnic model |
| | EQ.2: | Hybrid model with cold flow option in the gas chamber |
| | EQ.3: | Hybrid model with heat flow in the gas chamber |
| | EQ.4: | Hybrid model with heat flow in one additional gas chamber |
| | EQ.5: | Hybrid model with heat flow in two additional gas chambers |
| OUT_TYPE | Selects the simulation. | output file format that will be used in an airbag |
| | EQ.0: | Screen output calibration output (see Remark 4) |
| | EQ.1: | CESE compressible flow solver (default) |
| | EQ.2: | ALE solver |
| | EQ.3: | CPM solver (with 2 nd -order expansion of $C_{\scriptscriptstyle p}$) |
| | EQ.4: | CPM solver (with 4th-order expansion of C_p) |
| TRUNTIM | Total run tin | ne. |
| DELT | Delta(t) to us | se in the model calculation. |
| PTIME | Time interva | al for output of time history data to FILE. |
| FILE | | ASCII file in which to write the time history data and utput by the inflator simulation. |
| DENSITY | Density of a | condensed-phase species present in the inflator. |
| Species Name | Chemkin-co | mpatible name of a condensed-phase species. |

Remarks:

1. If MODEL = 3, the solution of an elementary reaction system is required for the finite-rate chemistry in the gas chamber. For MODEL = 4 and 5, the condensed phase is computed only in the combustion chamber.

LS-DYNA R12 4-11 (CHEMISTRY)

- 2. Output file includes all of the necessary thermodynamics variables and load curves for the species mass flow rate, temperature, and density curve. This will make it possible to generate the velocity curve which is required by each solver that carries out an airbag simulation.
- 3. At least one of these cards will be input if condensed-phase species are present during the propellant combustion. In this case, the user must specify each condensed-phase density. This density is then used to compute the volume fractions in both the combustion and gas chamber, where the energy equations are needed.
- 4. If OUT_TYPE = 0, the propellant information will be displayed on the screen, including total mass, remaining mass percentage, and mass burning rate versus time, and the calibration data will be saved in the output file, including the time versus pressure, temperature, total mass flow rate, and individual species mass fractions for all chambers. With this option, the user can quickly see the effect of changing the parameters on the first three *CHEMISTRY_INFLATOR_PROPERTIES cards.

4-12 (CHEMISTRY) LS-DYNA R12

*CHEMISTRY_CONTROL_TBX

Purpose: Specify a chemistry solver for use in conjunction with stochastic TBX particles. This is intended only for modeling the second phase of an explosion where the explosive has embedded metal (aluminum) particles that are too large to have burned in the first phase of the explosion.

This chemistry card points to a *CHEMISTRY_MODEL card (via IDCHEM) with its associated *CHEMISTRY_COMPOSITION cards to set up the initial conditions. That is, it establishes the spatial distribution of the species in the model.

It is assumed that there is no chemical reaction rate information in the chemistry model files. This is done since a special chemical reaction mechanism is implemented for TBX modeling. If particles other than solid aluminum particles are embedded in the explosive, then another burn model has to be implemented.

Surface Part Card. Card 1 format used when the PART keyword option is active.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|--------|--------|---|---|---|---|---|---|
| Variable | IDCHEM | USEPAR | | | | | | |
| Туре | I | I | | | | | | |
| Default | none | 1 | | | | | | |

| VARIABLE | DESCRIPTION |
|----------|--|
| IDCHEM | Identifier for this chemistry solver. |
| USEPAR | Coupling flag indicating if a *STOCHASTIC_TBX_PARTICLES card is provided for this model: |
| | EQ.1: uses a *STOCHASTIC_TBX_PARTICLES card (default). |
| | EQ.0: does not use such a card. |

LS-DYNA R12 4-13 (CHEMISTRY)

*CHEMISTRY_CONTROL_ZND

Purpose: Computes the one-dimensional reduced chemistry of a ZND model. It is then used in the initialization of the chemistry part of the CESE solver. When this card is used, the *CESE_INITIAL_CHEMISTRY... cards must specify the progressive variable (degree of combustion) in the HIC field.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|--------|----|---------|------|--------|---|---|
| Variable | ID | | | | | | | |
| Туре | I | | | | | | | |
| Default | none | | | | | | | |

| Variable | F | EPLUS | Q0 | GAM | XYZD | DETDIR | | |
| | | 2, 200 | QU | CI IIVI | ΛΙΖD | DEIDIN | | |
| Type | F | F | F | F | F | I | | |

| VARIABLE | DESCRIPTION |
|----------|--|
| ID | Identifier for this full chemistry calculation. |
| F | Overdriven factor |
| EPLUS | EPLUS parameter of the ZND model. |
| Q0 | Q0 parameter of the ZND model. |
| GAM | GAM parameter of the ZND model. |
| XYZD | Position of the detonation front in the DETDIR direction. |
| DETDIR | Detonation propagation direction $(1 \Rightarrow X; 2 \Rightarrow Y; 3 \Rightarrow Z)$ |

4-14 (CHEMISTRY) LS-DYNA R12

*CHEMISTRY_DET_INITIATION

Purpose: Performs a one-dimensional detonation calculation based upon a chemical composition and initial conditions. It is then available for use immediately in the CESE solver for initializing a computation, or it can be subsequently used by the *CHEM-ISTRY_CONTROL_1D card in a later run. In the product regions, this card overrides the initialization of the *CESE_INITIAL_CHEMISTRY... cards.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |

| VARIABLE | DESCRIPTION |
|----------|---|
| COMP_ID | Chemical composition identifier of the composition for the steady-state propellant combustion (see Remark 1). |
| PDIA | Propellant diameter (see Remark 2). |
| PHEIGHT | Propellant height (see Remark 2). |
| PMASS | Individual cylinder (or sphere) propellant mass. |
| TOTMASS | Total propellant mass. |
| TFLAME | Adiabatic flame (combustion) temperature. |
| PINDEX | Power of the pressure in rate of burn model. |
| A0 | Steady-state constant. |
| TDELAY | Ignition time delay. |
| RISETIME | Rise time. |
| COMP1ID | Chemical composition identifier of composition to use in the combustion chamber. |
| VOL1 | Volume of the combustion chamber. |
| AREA1 | Area of the combustion chamber. |
| CD1 | Discharge coefficient of the combustion chamber. |
| P1 | Pressure in the combustion chamber. |

LS-DYNA R12 4-19 (CHEMISTRY)

| VARIABLE | DESCRIPTION |
|----------|---|
| T1 | Temperature in the combustion chamber. |
| DELP1 | Rupture pressure in the combustion chamber. |
| DELT1 | Elapsed time for breaking the burst disk between the chambers |
| COMP2ID | Chemical composition identifier of composition to use in the gas plenum. |
| VOL2 | Volume of the gas plenum. |
| AREA2 | Area of the gas plenum. |
| CD2 | Discharge coefficient of the gas plenum. |
| P2 | Pressure in the gas plenum. |
| T2 | Temperature in the gas plenum. |
| DELP2 | Rupture pressure in the gas plenum. |
| DELT2 | Elapsed time for breaking the burst disk between the chambers |
| COMP3ID | Chemical composition identifier of composition to use in the tank. |
| VOL3 | Volume of the tank. |
| Р3 | Pressure in the tank. |
| Т3 | Temperature in the tank. |
| COMP4ID | Chemical composition identifier of composition to use in the additional (second) gas chamber. |
| VOL4 | Volume of the second gas chamber. |
| P4 | Pressure in the second gas chamber. |
| T4 | Temperature in the second gas chamber. |
| DELP4 | Rupture pressure in the second gas chamber. |
| DELT4 | Elapsed time for breaking the burst disk between the first and second gas chambers |
| COMP5ID | Chemical composition identifier of composition to use in the additional (third) gas chamber. |

4-20 (CHEMISTRY) LS-DYNA R12

| VOL5 | Volume of the third gas chamber. |
|-------|--|
| P5 | Pressure in the third gas chamber. |
| T5 | Temperature in the third gas chamber. |
| DELP5 | Rupture pressure in the third gas chamber. |
| DELT5 | Elapsed time for breaking the burst disk between the second and third gas chambers |

Remarks:

- 1. The propellant composition can be obtained by running a chemical equilibrium program such as NASA CEA, the CHEETAH code, or the PEP code. LSTC provides a modified version of the PEP code along with documentation for users; it is available upon request.
- 2. A spherical shape for the propellant particles can be chosen if an identical value for the diameter and height is given.
- 3. To simulate a 4 or 5 chamber inflator, an additional chamber card can be used. In these cases of the inflator models, the condensed phase species are limited to the combustion chamber only if involved in the propellant combustion.

LS-DYNA R12 4-21 (CHEMISTRY)

*CHEMISTRY_MODEL

Purpose: Identifies the files that define a Chemkin chemistry model.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |

- *DUALCESE_EOS_REFPROP
- *DUALCESE_EOS_REFPROP_PATH
- *DUALCESE_FSI_EXCLUDE

LS-DYNA R12 5-1 (DUALCESE)

*DUALCESE

*DUALCESE_INCLUDE_MODEL

*DUALCESE_INITIAL

*DUALCESE_INITIAL_{OPTION}

*DUALCESE_MAT_GAS

*DUALCESE MAT GAS 0

*DUALCESE_MAT_GAS_2

*DUALCESE_MODEL

*DUALCESE_NODE2D

*DUALCESE_NODE3D

*DUALCESE_NODESET

*DUALCESE_PART

*DUALCESE_SEGMENTSET

The structure of the keyword setup for the *DUALCESE solvers is different from the way most keyword input is handled in the LS-DYNA input phase. This stems from the fact that there can be several *DUALCESE models in the same problem. In order to deal with this, each such model is restricted to be specified with one file hierarchy that starts with the keyword file designated with the *DUALCESE_MODEL card. That keyword file can include any number of other keyword files with the *DUALCESE_INCLUDE_MODEL card, and each of those files can in turn include other keyword files, again with the *DUALCESE_INCLUDE_MODEL card. Standard *INCLUDE cards are not allowed. In fact, in each file in the file hierarchy of a *DUALCESE_MODEL card, only *DUALCESE cards may be used. The only exception to this is when the fluid mesh is defined using *MESH cards; a fatal error will be encountered when using other non-*DUALCESE keywords.

For each dual CESE model, it is very important that its mesh be defined within the keyword input file hierarchy for that model. If a mesh created with *MESH cards is used, the *MESH cards for that mesh must all be defined within the scope of the *DU-ALCESE_MODEL card.

Any required non-*DUALCESE keyword cards should be defined in some other place in the keyword input (outside the scope of the *DUALCESE_MODEL keyword card).

Since use of the REFPROP and COOLPROP equation of state (EOS) libraries is complex, clarification about their use is also required. Each of them is accessed via a shared

5-2 (DUALCESE) LS-DYNA R12

library that has to be loaded into LS-DYNA at runtime via a *MODULE_LOAD card such as:

```
*MODULE_LOAD
UserA DUALCESE REFPROP
<path to the installed REFPROP shared library>
```

Note that this *MODULE_LOAD card must not be given inside a keyword file in the file hierarchy of a *DUALCESE_MODEL card. As noted above, this is the case for all non-*DUALCESE keyword cards.

Note further that the REFPROP and COOLPROP libraries are not provided by ANSYS. The user needs to purchase REFPROP 9.1 from NIST (www.nist.gov) in order to make use of *DUALCESE_EOS_REFPROP, and then the user is required to build the REF-PROP shared library from the fortran source files provided by NIST.

For the COOLPROP shared library, the user can find the current production version here:

https://sourceforge.net/projects/coolprop/files/CoolProp/6.3.0/shared_library/Linux/64bit/

As the *DUALCESE capability is not yet working in the Windows build of LS-DYNA, do not attempt to use a Windows DLL version of the REFPROP shared library that comes with purchasing REFPROP 9.1, or download the Windows DLL version of COOLPROP.

Finally, it should be noted that capabilities implemented in the dual CESE solvers are only a part of what is available in the *CESE solvers that involve couplings with the *CHEMISTRY and *STOCHASTIC_PARTICLE solvers. It is planned to port many of those capabilities to the *DUALCESE solvers as well.

LS-DYNA R12 5-3 (DUALCESE)

*DUALCESE_BOUNDARY_AXISYMMETRIC_OPTION

Available options are

MSURF

SEGMENT_SET

Purpose: Define an axisymmetric boundary condition on the axisymmetric axis for the 2D axisymmetric dual CESE compressible flow solver.

The MSURF option is used when the dual CESE mesh has been created using *MESH cards. The SEGMENT_SET card is used when *DUALCESE_ELE2D or *DUALCESE_ELE3D cards are used to define the dual CESE mesh.

Surface Part Card. Card 1 format used when the MSURF keyword option is active. Provide as many cards as necessary. This input ends at the next keyword ("*") card.

| Card 1a | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|---|---|---|---|---|---|---|
| Variable | MSURF | | | | | | | |
| Туре | I | | | | | | | |
| Default | none | | | | | | | |

Segment Set Card. Card 1 format used when the SEGMENT_SET keyword option is active. Provide as many cards as necessary. This input ends at the next keyword ("*") card.

| Card 1b | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|---|---|---|---|---|---|---|
| Variable | SSID | | | | | | | |
| Туре | I | | | | | | | |
| Default | none | | | | | | | |

5-4 (DUALCESE) LS-DYNA R12

| VARIABLE | DESCRIPTION |
|----------|--|
| MSURF | Identifier of a mesh surface part ID, where the mesh surface part ID is referenced in *MESH_SURFACE_ELEMENT cards. |
| SSID | Segment set ID created with *DUALCESE_SEGMENTSET. |

Remarks:

1. This boundary condition can only be used on the axisymmetric axis for the 2D axisymmetric dual CESE fluid solver.

LS-DYNA R12 5-5 (DUALCESE)

*DUALCESE_BOUNDARY_FSI_OPTION

Available options are:

MSURF

SEGMENT SET

Purpose: Define an FSI boundary condition for the moving mesh dual CESE compressible flow solver. This keyword must not be combined with the dual CESE immersed-boundary method FSI solver in the same dual CESE part on the same dual CESE mesh. Doing so will result in an error termination condition.

This boundary condition must be applied on a surface of the dual CESE computational domain that is co-located with surfaces of the outside boundary of the structural mesh. The nodes of the two meshes will generally not be shared.

The MSURF option should be used when the dual CESE mesh has been created using *MESH cards. The SEGMENT_SET option should be used when *DUALCESE_ELE2D or *DUALCESE_ELE3D cards specify the CESE mesh.

Card Summary:

Card 1a. This card is included for the MSURF keyword option. Provide as many cards as necessary. This input ends at the next keyword ("*") card.

| MSPID | | | | |

| VARIABLE | DESCRIPTION |
|----------|---|
| SSID | Segment set ID for the segment set created with *DUALCESESEGMENTSET |

Remarks:

This boundary condition card is also needed for conjugate heat transfer problems with the moving mesh dual CESE solver.

LS-DYNA R12 5-7 (DUALCESE)

*DUALCESE_BOUNDARY_NON_REFLECTIVE_OPTION

Available options are:

MSURF

SEGMENT_SET

Purpose: Define a passive boundary condition for dual CESE compressible flows. This non-reflective boundary condition (NBC) provides an artificial computational boundary for an open boundary that is passive.

The MSURF option is used when the dual CESE mesh has been created using *MESH cards. The SEGMENT_SET card is used when *DUALCESE_ELE2D or *DUALCESE_ELE3D cards are used to define the dual CESE mesh.

Surface Part Card. Card 1 used when the MSURF keyword option is active. Include as many cards as necessary. This input ends at the next keyword ("*") card.

5-8 (DUALCESE) LS-DYNA R12

| VARIABLE | DESCRIPTION |
|----------|--|
| MSURF | Identifier of a mesh surface part ID, where the mesh surface part ID is referenced in *MESH_SURFACE_ELEMENT cards. |
| SSID | Segment set ID created with *DUALCESE_SEGMENTSET. |

Remarks:

- 1. This boundary condition is usually imposed on an open surface that is far from the main disturbed flow (the further away, the better), i.e., the flow on that boundary surface should be almost uniform.
- 2. If any boundary segment has not been assigned a boundary condition by any of the *DUALCESE_BOUNDARY_... cards, then it will automatically be assigned this non-reflective boundary condition.

LS-DYNA R12 5-9 (DUALCESE)

*DUALCESE_BOUNDARY_PRESCRIBED_OPTION

Available options include:

MSURF

SEGMENT_SET

Purpose: For the dual CESE compressible flow solver, set boundary values for velocity, density, pressure and temperature. Boundary values are applied at the centroid of elements connected with this boundary. OPTION = SEGMENT_SET is for user defined meshes whereas OPTION = MSURF is associated with the automatic volume mesher (See *MESH keywords).

That is, the MSURF option is used when the dual CESE mesh has been created using *MESH cards. The SEGMENT_SET card is used when *DUALCESE_ELE2D or *DUALCESE_ELE3D cards are used to define the dual CESE mesh.

Card Sets:

A set of data cards for this keyword consists of 3 of the following cards:

- 1. Card 1 specifies the object to which the boundary condition is applied. Its format depends on the keyword option.
- 2. Card 2 reads in load curve IDs.
- 3. Card 3 reads in scale factors.

For each boundary condition to be specified include one set of cards. This input ends at the next keyword ("*") card.

Surface Part Card. Card 1 format used when the MSURF keyword option is active.

| Card 1a | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|--------|---|---|---|---|---|---|
| Variable | MSURF | IDCOMP | | | | | | |
| Туре | I | I | | | | | | |
| Default | none | none | | | | | | |

5-10 (DUALCESE) LS-DYNA R12

Set Card. Card 1 format used when the SET keyword option is active.

| Card 1b | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|--------|---|---|---|---|---|---|
| Variable | SSID | IDCOMP | | | | | | |
| Туре | I | I | | | | | | |

| Card 2 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|-------|-------|--------|-------|-------|---|---|
| Variable | LC_U | LC_V | LC_W | LC_RHO | LC_P | LC_T | | |
| Туре | I | I | I | I | I | I | | |
| Remarks | 1,2,3 | 1,2,3 | 1,2,3 | 1,2,3 | 1,2,3 | 1,2,3 | | |

Scale Factor Card.

| Card 3 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|------|--------|------|------|---|---|
| Variable | SF_U | SF_V | SF_W | SF_RH0 | SF_P | SF_T | | |
| Туре | F | F | F | F | F | F | | |
| Default | 1.0 | 1.0 | 1.0 | 1.0 | 1.0 | 1.0 | | |
| Remarks | 2 | 2 | 2 | 2 | 2 | 2 | | |

| VARIABLE | DESCRIPTION |
|----------|--|
| MSURF | Identifier of a mesh surface part ID, where the mesh surface part ID is referenced in *MESH_SURFACE_ELEMENT cards. |
| SSID | Segment set ID created with *DUALCESE_SEGMENTSET. |

LS-DYNA R12 5-11 (DUALCESE)

| VARIABLE | DESCRIPTION |
|----------|--|
| IDCOMP | For inflow boundaries in problems involving chemical reacting flows, the chemical mixture of the fluid entering the domain is defined with a *CHEMISTRY_COMPOSITION card with this ID. |
| LC_U | Load curve ID to describe the x-component of the velocity versus time; see *DEFINE_CURVE. |
| LC_V | Load curve ID to describe the y-component of the velocity versus time. |
| LC_W | Load curve ID to describe the z-component of the velocity versus time. |
| LC_RHO | Load curve ID to describe the density versus time. |
| LC_P | Load curve ID to describe the pressure versus time. |
| LC_T | Load curve ID to describe the temperature versus time. |
| SF_U | Scale factor for LC_U (default = 1.0). |
| SF_V | Scale factor for LC_V (default = 1.0). |
| SF_W | Scale factor for LC_W (default = 1.0). |
| SF_RHO | Scale factor for LC_RHO (default = 1.0). |
| SF_P | Scale factor for LC_P (default = 1.0). |
| SF_T | Scale factor for LC_T (default = 1.0). |

Remarks:

- 1. On each centroid or set of centroids, the variables $(v_x, v_y, v_z, \rho, P, T)$ that are given values must be consistent and make the model well-posed (i.e., be such that the solution of the model exists, is unique and physical).
- 2. If any of the load curves are 0, the corresponding variable will take the constant value of the corresponding scale factor. For instance, if LC_RHO = 0, then the constant value of the density for this boundary condition will be SF_RHO.
- 3. If a load ID is -1 for a given variable, then the boundary value for that variable is computed by the solver, and not specified by the user.

5-12 (DUALCESE) LS-DYNA R12

*DUALCESE_BOUNDARY_PRESCRIBED_VN_OPTION

Available options include:

MSURF

SETMENT_SET

Purpose: For the dual CESE compressible flow solver, set boundary values for velocity, density, pressure and temperature. Boundary values are applied at the centroid of elements connected with this boundary. OPTION = SEGMENT_SET is for user defined meshes whereas OPTION = MSURF is associated with the automatic volume mesher (See *MESH keywords).

That is, the MSURF option is used when the dual CESE mesh has been created using *MESH cards. The SEGMENT_SET card is used when *DUALCESE_ELE2D or *DUALCESE_ELE3D cards is used to define the dual CESE mesh.

Card Sets:

A set of data cards for this keyword consists of 3 of the following cards:

- 1. Card 1 specifies the object to which the boundary condition is applied. Its format depends on the keyword option.
- 2. Card 2 reads in load curve IDs.
- 3. Card 3 reads in scale factors.

For each boundary condition to be specified include one set of cards. This input ends at the next keyword ("*") card.

Surface Part Card. Card 1 format used when the MSURF keyword option is active.

SSID Segment set ID

5-14 (DUALCESE) LS-DYNA R12

| VARIABLE | DESCRIPTION |
|----------|--|
| IDCOMP | For inflow boundaries in problems involving chemical reacting flows, the chemical mixture of the fluid entering the domain is defined with a *CHEMISTRY_COMPOSITION card with this ID. |
| LC_VN | Load curve ID to describe the normal velocity versus time; see *DEFINE_CURVE. |
| LC_RHO | Load curve ID to describe the density versus time. |
| LC_P | Load curve ID to describe the pressure versus time. |
| LC_T | Load curve ID to describe the temperature versus time. |
| SF_VN | Scale factor for LC_VN (default = 1.0). |
| SF_RHO | Scale factor for LC_RHO (default = 1.0). |
| SF_P | Scale factor for LC_P (default = 1.0). |
| SF_T | Scale factor for LC_T (default = 1.0). |

Remarks:

- 1. On each centroid or set of centroids, the variables (V_N , ρ , P, T) that are given values must be consistent and make the model well-posed (i.e., be such that the solution of the model exists, is unique and physical).
- 2. If any of the load curves are 0, the corresponding variable will take the constant value of the corresponding scale factor. For instance, if LC_RHO = 0, then the constant value of the density for this boundary condition will be SF_RHO.
- 3. If a load ID is -1 for a given variable, then the boundary value for that variable is computed by the solver, and not specified by the user.

LS-DYNA R12 5-15 (DUALCESE)

*DUALCESE_BOUNDARY_REFLECTIVE_OPTION

Available options are:

MSURF

SEGMENT_SET

Purpose: Define a reflective boundary condition (RBC) for the dual CESE compressible flow solver. This boundary condition can be applied on a symmetrical surface or a solid wall of the computational domain.

The MSURF option is used when the dual CESE mesh has been created using *MESH cards. The SEGMENT_SET option is used when *DUALCESE_ELE2D or *DUALCESE_ELE3D cards are used to define the dual CESE mesh.

Surface Part Card. Card 1 format used when the MSURF keyword option is active. Provide as many cards as necessary. This input ends at the next keyword ("*") card.

| Card 1a | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|---|---|---|---|---|---|---|
| Variable | MSURF | | | | | | | |
| Туре | I | | | | | | | |
| Default | none | | | | | | | |

Set Card. Card 1 format used when the SET keyword option is active. Provide as many cards as necessary. This input ends at the next keyword ("*") card.

| Card 1b | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|---|---|---|---|---|---|---|
| Variable | SSID | | | | | | | |
| Туре | I | | | | | | | |
| Default | none | | | | | | | |

5-16 (DUALCESE) LS-DYNA R12

| VARIABLE | DESCRIPTION |
|----------|--|
| MSURF_S | Identifier of a mesh surface part ID, where the mesh surface part ID is referenced in *MESH_SURFACE_ELEMENT cards. |
| SSID | Segment set ID created with *DUALCESE_SEGMENTSET |

Remarks:

1. This boundary condition has the same effect as a solid-wall boundary condition for inviscid flows.

LS-DYNA R12 5-17 (DUALCESE)

*DUALCESE_BOUNDARY_SOLID_WALL_OPTION1_OPTION2

For *OPTION1* the choices are:

MSURF

SEGMENT_SET

For *OPTION2* the choices are:

<BLANK>

ROTAT

Purpose: Define a solid wall boundary condition (SBC) for the dual CESE compressible flow solver. This boundary condition can be applied at a solid boundary that is the physical boundary for the flow field. For inviscid flow, this will be a slip boundary condition; while for viscous flows, it is a no-slip boundary condition.

The MSURF option is used when the dual CESE mesh has been created using *MESH cards. The SEGMENT_SET card is used when *DUALCESE_ELE2D or *DUALCESE_ELE3D cards are used to define the dual CESE mesh.

Card Sets. The following sequence of cards comprises a *single set*. LS-DYNA will continue reading *DUALCESE_BOUNDARY_SOLID_WALL card sets until the next keyword ("*") card is encountered.

Surface Part Card. Card 1 format used when the MSURF keyword option is active.

| Card 1a | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |

| Variable | SSID | LCID | Vx | Vy | Vz | Nx | Ny | Nz |
| Туре | I | I | F | F | F | F | F | F |
| Default | none | 0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 |
| Remarks | | 2, 3 | 2 | 2 | 2 | 3 | 3 | 3 |

Rotating Axis Card. Additional card for the "Segment Card" case that is read when the ROTAT keyword option is used.

| Card 2 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-----|-----|-----|---|---|---|---|---|
| Variable | Nx | Ny | Nz | | | | | |
| Type | F | F | F | | | | | |
| Default | 0.0 | 0.0 | 0.0 | | | | | |
| Remarks | 3 | 3 | 3 | | | | | |

| VARIABLE | DESCRIPTION |
|----------|--|
| MSURF | Identifier of a mesh surface part ID, where the mesh surface part ID is referenced in *MESH_SURFACE_ELEMENT cards. |
| SSID | Segment set ID created with *DUALCESE_SEGMENTSET. |
| LCID | Load curve ID to define this solid wall boundary movement |

If OPTION2 = <BLANK>:

Vx, Vy, Vz velocity vector of the solid wall:

LCID.EQ.0: it is defined by (Vx, Vy, Vz) itself;

LCID.NE.0: it will be defined by both of the load curve and (Vx, Vy, Vz); Nx, Ny, Nz are not used in this case.

LS-DYNA R12 5-19 (DUALCESE)

VARIABLE

DESCRIPTION

If OPTION2 = ROTAT:

Vx, Vy, Vz x-,y- & z-coordinates of a point on the rotating axis

Nx, Ny, Nz Unit vector of the rotating axis (for the 2D case, this is not used).

The rotating frequency (Hz) is given by the load curve.

Remarks:

1. In this solid-wall condition (SBC), the boundary movement can only be in the tangential direction of the wall and should not affect the fluid domain size and mesh during the calculation, otherwise an FSI or moving mesh solver should be used. Also, this moving SBC only affects viscous flows (no-slip BC).

- 2. If LCID = 0 and Vx = Vy = Vz = 0.0 (default), this will be a regular solid wall BC.
- 3. For rotating SBC, LCID > 0 must be used to define the rotating speed frequency (Hz). Also, in the 2D case, (Nx, Ny, Nz) does not need to be defined because it is not needed.

5-20 (DUALCESE) LS-DYNA R12

*DUALCESE_CONTROL_LIMITER

Purpose: Sets some stability parameters used in the dual CESE compressible flow solver on the current dual CESE model.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|------|------|------|---|---|---|---|
| Variable | IDLMT | ALFA | BETA | EPSR | | | | |
| Туре | I | F | F | F | | | | |
| Default | 0 | 0.0 | 0.0 | 0.0 | | | | |
| Remarks | | 1 | 2 | 3 | | | | |

| VARIABLE | DESCRIPTION |
|----------|---|
| IDLMT | Set the stability limiter option (See dual CESE theory manual): |
| | EQ.0: limiter format 1 (Re-weighting). |
| | EQ.1: limiter format 2 (Relaxing). |
| ALFA | Re-weighting coefficient (See dual CESE theory manual) |
| BETA | Numerical viscosity control coefficient (See dual CESE theory manual) |
| EPSR | Stability control coefficient (See dual CESE theory manual) |

Remarks:

- 1. $\alpha \ge 0$; larger values give more stability, but less accuracy. Usually $\alpha = 2.0$ or 4.0 will be enough for normal shock problems.
- 2. $0 \le \beta \le 1$; larger values give more stability. For problems with shock waves, $\beta = 1.0$ is recommended.
- 3. $\varepsilon \ge 0$; larger values give more stability, but less accuracy.

LS-DYNA R12 5-21 (DUALCESE)

*DUALCESE_CONTROL_MESH_MOV

Purpose: For the moving mesh dual CESE solver, this keyword is used to choose the type of algorithm to be used for calculating mesh movement.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|---|---|---|---|---|---|---|
| Variable | MMSH | | | | | | | |
| Туре | I | | | | | | | |
| Default | 1 | | | | | | | |

| VARIABLE | DESCRIPTION |
|----------|--|
| MMSH | Mesh motion selector:. |
| | EQ.9: the IDW scheme is used to move the mesh. |

.

5-22 (DUALCESE) LS-DYNA R12

*DUALCESE_CONTROL_SOLVER

Purpose: Set general purpose control variables for the dual CESE compressible flow solver.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|-------|--------|---|------|-------|---|---|
| Variable | EQNS | IGEOM | IFRAME | | IDC | ISNAN | | |
| Туре | А | Α | А | | F | I | | |
| Default | EULER | none | FIXED | | 0.25 | 0 | | |
| Remarks | | 1,2 | | | 3 | | | |

| VARIABLE | DESCRIPTION |
|----------|--|
| EQNS | Select the equations being solved with the dual CESE solver. |
| | EQ.NS: Navier-Stokes equations |
| | EQ.EULER: Euler equations |
| IGEOM | Sets the geometric dimension: |
| | EQ.2D: Two-dimensional (2D) problem |
| | EQ.3D: Three-dimensional (3D) problem |
| | EQ.AXI: 2D axisymmetric |
| IFRAME | Choose the frame of reference: |
| | EQ.FIXED: Usual non-moving reference frame (default). |
| | EQ.ROT: Non-inertial rotating reference frame. |
| | EQ.ROTATING: Non-inertial rotating reference frame |
| IDC | Contact interaction detection coefficient (for FSI and conjugate |

LS-DYNA R12 5-23 (DUALCESE)

heat transfer problems).

| VARIABLE | DESCRIPTION |
|----------|--|
| ISNAN | Flag to check for a NaN in the dual CESE solver solution arrays at the completion of each time step. This option can be useful for debugging purposes. There is a cost overhead when this option is active. |
| | EQ.0: No checking, |
| | EQ.1: Checking is active. |

Remarks:

- 1. If the user wants to use the 2D (IGEOM = 2D) or 2D axisymmetric (IGEOM = AXI) solver, the mesh should only be distributed in the x-y plane with the boundary conditions given only at the x-y domain boundaries. Otherwise, a warning message will be given and the 3D solver will be triggered instead.
- 2. The 2D axisymmetric case will work only if the 2D mesh and corresponding boundary conditions are properly defined, with the *x* and *y* coordinates corresponding to the radial and axial directions respectively.
- 3. IDC is the same type of variable that is input on the *ICFD_CONTROL_FSI card. For an explanation, see Remark 1 for the *ICFD_CONTROL_FSI card.

5-24 (DUALCESE) LS-DYNA R12

*DUALCESE_CONTROL_TIMESTEP

Purpose: Sets the time-step control parameters for the CESE compressible flow solver.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|-----|--------|---|---|---|---|---|
| Variable | IDDT | CFL | DTINT | | | | | |
| Туре | I | F | F | | | | | |
| Default | 0 | 0.9 | 1.0E-3 | | | | | |

| VARIABLE | DESCRIPTION |
|----------|--|
| IDDT | Sets the time step option: |
| | EQ.0: Fixed time step size (DTINT, i.e., given initial time step size) |
| | NE.0: the time step size will be calculated based on the given CFL-number and the flow solution at the previous time step. |
| CFL | CFL number (Courant–Friedrichs–Lewy condition) ($0.0 < \text{CFL} \le 1.0$) |
| DTINT | Initial time step size |

LS-DYNA R12 5-25 (DUALCESE)

*DUALCESE_D3PLOT

Purpose: Specify the flow variables to be added to the dual CESE d3plot output.

Provide as many cards as necessary. This input ends at the next keyword ("*") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | | |

5-32 (DUALCESE) LS-DYNA R12

*DUALCESE_EOS_COOLPROP

Purpose: Define an equation of state (EOS) to be evaluated using the COOLPROP EOS library

Note that the COOLPROP library is not provided by ANSYS. You need to download a 64-bit version of the shared library from a public repository, such as:

https://sourceforge.net/projects/coolprop/files/CoolProp/6.3.0/shared_library/Linux/64bit/

WARNING: Since the *DUALCESE capability is not yet working in the Windows build of LS-DYNA, do *not* attempt to use a Windows DLL version of the COOLPROP shared library.

To use the COOLPROP shared library with this keyword card, load this shared library into LS-DYNA using the *MODULE capability. The following *MODULE card needs to appear before a *DUALCESE_MODEL card (not inside the file hierarchy of any file specified with a *DUALCESE_MODEL card):

```
*MODULE_LOAD
UserA DUALCESE COOLPROP
< path to installed COOLPROP shared library >
```

| FLUIDNAME | Name of a fluid that has an EOS in CoolProp. | For a list of the |

LS-DYNA R12 5-35 (DUALCESE)

VARIABLE

DESCRIPTION

supported pure and pseudo-pure fluids, see:

http://www.coolprop.org/fluid_properties/PurePseudoPure.html#list-of-fluids

Note that the predefined fluid mixtures are not supported at this time.

Remarks:

- 1. **Number of Values in the Lookup Tables.** The number of density and temperature values in the tables should not be too few to give good resolution of the EOS. Note that the cost of building the EOS from these tables rises with these numbers, as well as the computer memory required. Nevertheless, if these numbers are too small (< 20), then the accuracy may suffer, while larger numbers of density and temperature points improves the accuracy.
- 2.**Valid Value Ranges for the Lookup Tables.** For many equations of state in the CoolProp library, there is a range of valid densities and temperatures. Thus, the low and high limits for the table densities and temperatures should not lie outside these ranges. Please refer to the CoolProp documentation for that information.

5-36 (DUALCESE) LS-DYNA R12

*DUALCESE_EOS_IDEAL_GAS

Purpose: Define the coefficients **Cv** and **Cp** in the equation of state for an ideal gas in the dual CESE fluid solver.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|-------|--------|---|---|---|---|---|
| Variable | EOSID | Cv | Ср | | | | | |
| Туре | I | F | F | | | | | |

| VARIABLE | DESCRIPTION |
|----------|------------------------------------|
| EOSID | Equation of state identifier |
| Cv | Specific heat at constant volume |
| Ср | Specific heat at constant pressure |

Remarks:

1. **Units.** As with other solvers in LS-DYNA, the user is responsible for unit consistency. For example, if a user wants to use dimensionless variables, Cv and Cp above also should be replaced by the corresponding dimensionless ones. If the dual CESE model has specified a system of units either directly in the *DUALCESE_MODEL card, or inherited a choice of units from the overall problem input, then these values need to be given in that unit system.

LS-DYNA R12 5-37 (DUALCESE)

*DUALCESE_EOS_INFLATOR1

Purpose: To define an EOS using Cp and Cv thermodynamic expansions for an inflator gas mixture with a single temperature range.

VARIABLEDESCRIPTIONCV10, ...,
CV14Coefficients of temperature-dependent specific heat at constant
volume valid for T < 1000 K</td>CV20, ...,
CV24Coefficients of temperature-dependent specific heat at constant
volume valid for T > 1000 K

Cards 4 and 5 give C_v over the two temperature ranges:

$$C_v(T) = \begin{cases} \text{CV10} + \text{CV11} \times T + \text{CV12} \times T^2 + \text{CV13} \times T^3 + \text{CV14} \times T^4 & \text{for } T < 1000 \text{ K} \\ \text{CV20} + \text{CV21} \times T + \text{CV22} \times T^2 + \text{CV23} \times T^3 + \text{CV24} \times T^4 & \text{for } T > 1000 \text{ K} \end{cases}$$

Remarks:

These coefficient expansions for the specific heats over two temperature ranges are generated by the zero-dimensional inflator model solver. See *CHEMISTRY_CONTROL_INFLATOR and *CHEMISTRY_INFLATOR_PROPERTIES for details related to running that solver.

5-42 (DUALCESE) LS-DYNA R12

*DUALCESE_EOS_REFPROP

Purpose: Define an equation of state (EOS) to be evaluated using the REFPROP EOS library

Note that the REFPROP library is not provided by ANSYS. You need to purchase REF-PROP 9.1 from NIST. Then you must build the REFPROP shared library from the fortran source files provided by NIST.

WARNING: Since the *DUALCESE capability is not yet working in the Windows build of LS-DYNA, do *not* attempt to use a Windows DLL version of the REFPROP shared library that comes with purchasing REFPROP 9.1.

To use the REFPROP shared library with this keyword card, load this shared library into LS-DYNA using the *MODULE capability. The following *MODULE card needs to appear before a *DUALCESE_MODEL card (not inside the file hierarchy of any file specified with a *DUALCESE_MODEL card):

```
*MODULE_LOAD
UserA DUALCESE REFPROP
< path to the installed REFPROP shared library >
```

In addition, for REFPROP to be able to find the appropriate EOS data, *DUALCESE_-EOS_REFPROP_PATH must also be given somewhere inside a *DUALCESE_MODEL file hierarchy to point to the place in your filesystem where REFPROP has been installed.

Card Summary:

Card 1. This card is required.

| EOSID | NCOMP | TYPE | PHASE | TABULAR | | | |
|-------|-------|------|-------|---------|--|--|--|
|-------|-------|------|-------|---------|--|--|--|

Card 2. Include as many cards as needed to specify mole fractions for the NCOMP components of the fluid.

LS-DYNA R12 5-45 (DUALCESE)

Name of REFPROP fluid. This card is required.

| Card 4 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | |
|----------|---|-----------|---|---|---|---|---|---|--|
| Variable | | FLUIDNAME | | | | | | | |
| Type | Α | | | | | | | | |

VARIABLE

DESCRIPTION

FLUID-NAME Name of a fluid that has an EOS in REFPROP. For a list of the supported pure and pseudo-pure fluids, see Appendix A of this document:

https://www.nist.gov/system/files/documents/srd/REFPR OP9.PDF.

Note that the predefined fluid mixtures are not supported at this time.

Remarks:

- 1. **Number of Values in the Lookup Table.** The number of values of density and temperature axes of the tables should not be too few to give good resolution of the EOS. Note that the cost of building the EOS from these tables rises with these numbers, as well as the computer memory required. Nevertheless, if these numbers are too small (< 20), then the accuracy may suffer, while larger numbers of density and temperature points improves the accuracy.
- 2. **Valid Value Ranges for the Lookup Tables.** For many equations of state in the REFPROP library, a range of densities and temperatures are valid. Thus, the low and high limits for the table densities and temperatures should not lie outside these ranges. Please refer to the REFPROP documentation for that information.

5-46 (DUALCESE) LS-DYNA R12

*DUALCESE_EOS_REFPROP_PATH

Purpose: Provide the file path to the directory where the REFPROP EOS system is installed.

Note that in any problem where a *DUALCESE_EOS_REFPROP card is used, you must also provide a *DUALCESE_EOS_REFPROP_PATH card somewhere inside a *DUALCESE_MODEL file hierarchy to point to the place in your filesystem where REFPROP has been installed so that the appropriate EOS data can be loaded.

| VARIABLE | DESCRIPTION | | | | | |
|----------|--|--|--|--|--|--|
| PATH | Path giving the directory where the REFPROP data is installed. | | | | | |

LS-DYNA R12 5-47 (DUALCESE)

*DUALCESE_FSI_EXCLUDE

Purpose: Provide a list of mechanics solver parts that are not involved in the dual CESE FSI calculation. This keyword is intended for increasing computational efficiency by excluding parts that will not involve significant FSI interactions with the dual CESE compressible fluid solver.

Include as many cards as needed. This input ends at the next keyword ("*") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |

| | interaction calculation with the dual CESE solver |

5-48 (DUALCESE) LS-DYNA R12

*DUALCESE_INCLUDE_MODEL

Purpose: Provide the filename of a file containing additional keywords belonging to a dual CESE model. Any number of these *DUALCESE_INCLUDE_MODEL keywords may be used in a single dual CESE model, where at the top level the overall model begins with a *DUALCESE_MODEL card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|---|---|---|-------|------|---|---|---|
| Variable | | | | FILEN | IAME | | | |
| Туре | | | | A | A | | | |

VARIABLE DESCRIPTION

FILENAME

Filename of the keyword file containing more of the dual CESE model. This card is only allowed inside a file that is given in one instance of a *DUALCESE_MODEL keyword card.

LS-DYNA R12 5-49 (DUALCESE)

*DUALCESE_INITIAL

Purpose: Specify constant initial conditions (ICs) for flow variables at the centroid of each fluid element.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|---|-----|-----|-------|-----|-----|---|---|
| Variable | U | V | W | RH | Р | T | | |
| Туре | F | F | F | F | F | F | | |
| Default | 0 | 0.0 | 0.0 | 1.225 | 0.0 | 0.0 | | |

| VARIABLE | DESCRIPTION |
|----------|--|
| U, V, W | x-, y-, z-velocity components respectively |
| RHO | density p |
| P | pressure P |
| T | temperature T |

Remarks:

- 1. **Required Input.** Usually, only two of ρ , P & T are needed to be specified (besides the velocity). If all three are given, only ρ and P will be used.
- 2. **Applicable Elements.** These initial condition will be applied in those elements that have not been assigned a value by *DUALCESE_INITIAL_*OPTION* cards for individual elements or sets of elements.

5-50 (DUALCESE) LS-DYNA R12

*DUALCESE_INITIAL_SET

Purpose: Specify initial conditions for the flow variables at the centroid of each element in a set of dual CESE elements.

| Include as many | v cards as needed. | This in | put ends at | the next key | vword (| ("*") | card. |
|----------------------|--------------------|---------|------------------|--------------|---------|-------|-------|

| Remarks | | | | | 1 | 1 | 1 | |

| VARIABLE | DESCRIPTION |
|----------|--|
| ESID | Element set ID (see *DUALCESE_ELEMENTSET).). |
| U, V, W | x-, y-, z-velocity components respectively |
| RHO | density |
| P | pressure |
| T | temperature |

Remarks:

- 1. Usually, only two of ρ , P and T are needed to be specified (besides the velocity). If all three are given, only ρ and P will be used.
- 2. The priority of this card is higher than *DUALCESE_INITIAL, i.e., if an element is assigned an initial value by this card, *DUALCESE_INITIAL will no longer apply to that element.

*DUALCESE_MAT_GAS

Purpose: Define the fluid (gas) properties in a viscous flow for the dual CESE solver. In this model, the dynamic viscosity is determined using Sutherland's formula for viscosity, and the thermal conductivity is determined using the Prandtl Number.

Include as many cards as needed. This input ends at the next keyword ("*") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |

| Variable | MID | C1 | C2 | PRND | | | | |
| Туре | 1 | F | F | F | | | | |
| Default | none | 1.458E-6 | 110.4 | 0.72 | | | | |

| VARIABLE | DESCRIPTION |
|----------|---|
| MID | Material ID |
| C1, C2 | Two coefficients in the Sutherland's formula for viscosity: |
| | $\mu = \frac{C_1 T^{3/2}}{T + C_2} \ .$ |
| | Here C_1 and C_2 are constants for a given gas. For example, for air at moderate temperatures |
| | $C_1 = 1.458 \times 10^{-6} \mathrm{kg/msK^{1/2}}, C_2 = 110.4 \mathrm{K}$ |
| PRND | Prandtl Number (used to determine the coefficient of thermal |

air at standard conditions PRND = 0.72.

Remarks:

1. **Inviscid Flows.** C1 and C2 are only used to calculate the viscosity in viscous flows, so for inviscid flows, this material card is not needed.

conductivity). It is approximately constant for most gases. For

- 2. **Thermal Coupling.** The Prandtl number is used to extract the thermal conductivity. It is only needed when thermal coupling with the structure is activated.
- 3. **Unit Consistency.** As with other solvers in LS-DYNA, you are responsible for unit consistency. For example, if dimensionless variables are used, C_1 and C_2

should be replaced by the corresponding dimensionless ones. If the dual CESE model has a specified system of units either directly from the *DUALCESE_-MODEL card or inherited from the overall problem input, then these values need to be given in that unit system. Also, note that the formulas here require the temperature be given in either Kelvin or Rankine units.

*DUALCESE_MAT_GAS_0

Purpose: Define the fluid (gas) properties in a viscous flow for the dual CESE solver. In this model, the dynamic viscosity and thermal conductivity are specified constants.

Material Definition Cards. Include one card for each instance of this material type. This input ends at the next keyword ("*") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|------|---|---|---|---|---|
| Variable | MID | MU | K | | | | | |
| Туре | I | F | F | | | | | |

| VARIABLE | DESCRIPTION |
|----------|--|
| MID | Material ID |
| MU | Fluid dynamic viscosity. $MU = 1.81 \times 10^{-5} \text{ kg/ms}$ for air at 15°C. |
| K | Thermal conductivity of the fluid |

Remarks:

- 1. **Fields that Depend on Problem Physics.** The viscosity is only used viscous flows, so for inviscid flows, it is not necessary to define it. The thermal conductivity is only used to calculate the heat transfer between the structure and the thermal solver when coupling is activated.
- 2. **Unit Consistency.** As with other solvers in LS-DYNA, you are responsible for unit consistency. For example, if dimensionless variables are used, MU should be replaced by the corresponding dimensionless one. If the dual CESE model has a specified system of units either directly from the *DUALCESE_MODEL card or inherited from the overall problem input, then these values need to be given in that unit system.

*DUALCESE_MAT_GAS_2

Purpose: Define the fluid (gas) properties in a viscous flow for the dual CESE solver. This model determines dynamic viscosity and thermal conductivity by combining Sutherland's formula with the Power law for dilute gases.

Material Definition Cards. Include one card for each instance of this material type. This input ends at the next keyword ("*") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |

VARIABLE

DESCRIPTION

MID

Material ID

MU0 / SMU

Two coefficients appearing in the equation derived by combining Sutherland's formula with the Power law for dilute gases:

$$\frac{\mu}{\mu_0} = \left(\frac{T}{T_0}\right)^{3/2} \frac{T_0 + S_{\mu}}{T + S_{\mu}} \ .$$

Here μ is the dynamic viscosity, μ_0 is a reference value, and S_{μ} is an effective temperature called the Sutherland constant which is characteristic of the gas. For air at moderate temperatures,

$$\mu_0 = 1.716 \times 10^{-5} \,\mathrm{Ns/m^2}$$
, $S_u = 111 \,\mathrm{K}$

K0/SK

Two coefficients appearing in the equation derived by combining Sutherland's formula with the Power law for dilute gases:

$$\frac{k}{k_0} = \left(\frac{T}{T_0}\right)^{3/2} \frac{T_0 + S_k}{T + S_k} \ .$$

Here k is the thermal conductivity, k_0 is a reference value, and S_k is the Sutherland constant, which is characteristic of the gas. For air at moderate temperatures,

$$k_0 = 0.0241 \,\, \mathrm{W/m} \,, \qquad S_k = 194 \,\, \mathrm{K}$$

| VARIABLE | DESCRIPTION |
|----------|---|
| T0 | Reference temperature, T_0 . The default value (273.0) is for air in K. |

Remarks:

- 1. **Fields that Depend on Problem Physics.** The viscosity is only used for viscous flows, so for inviscid flows, it is not necessary to define it. The thermal conductivity is only used to calculate the heat transfer between the structure and the thermal solver when coupling is activated.
- 2. **Unit Consistency.** As with other solvers in LS-DYNA, you are responsible for unit consistency. For example, if dimensionless variables are used, MU should be replaced by the corresponding dimensionless one. If the dual CESE model has a specified system of units either directly from the *DUALCESE_MODEL card or inherited from the overall problem input, then these values need to be given in that unit system. Also, note that the formulas here require the temperature be given in either Kelvin or Rankine units.

*DUALCESE_MODEL

Purpose: Set the units used by a dual CESE compressible flow problem, along with the name of the file specifying the dual CESE model. There can be any number of such models (each with a separate mesh), and each such model must be in a different file.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | |
|----------|---------|---|----------|---|---|---|---|---|--|

Node ID Cards. Set one value per node in the set. Include as many cards as needed. This input ends at the next keyword ("*") card.

| Card 2 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|------|------|------|------|------|------|
| Variable | NID1 | NID2 | NID3 | NID4 | NID5 | NID6 | NID7 | NID8 |
| Туре | I | I | I | I | I | I | I | I |

| VARIABLE | DESCRIPTION |
|----------|--|
| NSID | Set ID of new node set. All dual CESE node sets should have a unique set ID. |
| NIDi | Node ID i |

*DUALCESE_PART *DUALCESE

*DUALCESE_PART

Purpose: Define dual CESE solver parts, i.e., connect dual CESE material and EOS information. It also provides a means to restrict the type of solver used on a region of a dual CESE mesh. That is, an immersed boundary FSI solver, a moving mesh FSI solver, or a non-FSI Eulerian solver can be specified for just this part.

Part Cards. Include one card for each CESE part. This input ends at the next keyword ("*") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|-------|---------|------------|---|---|---|
| Variable | PID | MID | EOSID | FSITYPE | MOVMESH_ID | | | |
| Туре | 1 | I | I | А | I | | | |
| Default | none | none | none | none | none | | | |

| VARIABLE | DESCRIPTION |
|------------|--|
| PID | Part identifier (must be different from any PID on a *PART card) |
| MID | Material identifier defined by a *DUALCESE_MAT card |
| EOSID | Equation of state identifier defined by a *DUALCESE_EOS card |
| FSITYPE | FSI type to use on this part: |
| | BLANK: no FSI performed |
| | EQ.IBM: Immersed boundary FSI solver |
| | EQ.MMM: Moving mesh FSI solver |
| | EQ.MOVMESH: Moving mesh FSI solver |
| MOVMESH_ID | Identifier of the mesh motion algorithm to use for the moving mesh FSI solver on this part (region of the current dual CESE mesh). |

Remarks:

1. Since material coefficients are only used in viscous flows, the MID can be left blank for inviscid flows.

*DUALCESE_SEGMENTSET

Purpose: Define a set of segments. For three-dimensional geometries, a segment can be triangular or quadrilateral. For two-dimensional geometries, a segment is a line defined by two nodes.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |

Table 5-1. Face definitions for volume dual CESE elements

*EM

The *EM keyword cards provide input for a new electromagnetism module for solving 3D eddy-current, inductive heating or resistive heating problems, coupled with mechanical and thermal solvers. Typical applications include magnetic metal forming and welding. A boundary element method in the air is coupled to finite elements in the conductor in order to avoid meshing the air.

LS-DYNA R12 6-3 (EM)

*EM_2DAXI

*EM_2DAXI

Purpose: Sets up the electromagnetism solver as 2D axisymmetric instead of 3D, on a given part, in order to save computational time as well as memory.

The electromagnetism is solved in 2D on a given cross section of the part (defined by a segment set), with a symmetry axis defined by its direction (at this time, it can be the x, y, or z axis). The EM forces and Joule heating are then computed over the full 3D part by rotations. The part needs to be compatible with the symmetry, i.e. each node in the part needs to be the child of a parent node on the segment set, by a rotation around the axis. Only the conductor parts (with a *EM_MAT_... of type 2 or 4) should be defined as 2D axisymmetric.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|---|---|----------|---------|--------|---|
| Variable | PID | SSID | | | STARSSID | ENDSSID | NUMSEC | |
| Туре | I | I | | | I | I | I | |
| Default | none | none | | | none | none | none | |

| VARIABLE | DESCRIPTION |
|----------------------|--|
| PID | Part ID of the part to be solved using 2D axisymmetry |
| SSID | Segment Set ID : Segment that will define the 2D cross section of the part where the EM field is solved |
| STARSSID, ENDSSID | Used by the 2D axisymmetric solver to make the connection between two corresponding boundaries on each side of a slice when the model is a slice of the full 360 circle. |
| NUMSEC | Number of Sectors. This field gives the ratio of the full circle to the angular extension of the mesh. This has to be a power of two. For example, NUMSEC = 4 means that the mesh of the part represents one fourth of the total circle. If this value is set to 0, then the value from *EM_ROTATION_AXIS is used instead. |

Remarks:

1. At this time, *either* all or none of the conductor parts should be 2D axisymmetric. In the future, a mix between 2D axisymmetric and 3D parts will be allowed.

6-4 (EM) LS-DYNA R12

*EM

*EM_BOUNDARY

Purpose: Define some boundary conditions for the electromagnetism problems.

Include as many cards as needed. This input ends at the next keyword (" \ast ") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |

6-6 (EM) LS-DYNA R12

| VARIABLE | DESCRIPTION |
|--------------|--|
| SETID | Set ID |
| VAL | Value of the Resistance, current density or potential depending on BPTYPE. Ignored if LCID is defined. |
| LCID | Load curve ID defining the value of the resistance, voltage or current function of time. If a negative value is entered, a *DE-FINE_FUNCTION will be expected. The following parameters are allowed: ($time$, $emdt$, $curr$, pot , $cond$, $temp$, $potglob$, $currglob$, $areaglob$, $area$, x , y , z). Pot / $curr$ / $area$ and $potglob$ / $currglob$ / $areaglob$ are the local value of the scalar potential/current/area and the global averaged value on the prescribed boundary respectfully. $Cond$ is the local electrical conductivity and x , y , z the local coordinates. |
| BIRTHT/DEATH | Birth and death times for that prescribed boundary. |

Remarks:

1. This keyword is available for the Resistive heating solver (solver type 3) only for the moment.

LS-DYNA R12 6-7 (EM)

*EM_CIRCUIT

*EM_CIRCUIT_{OPTION}

Available options include

SOURCE

Purpose: Define an electrical circuit.

For the SOURCE option, the current will be considered uniform in the circuit. In general, this is used to model stranded conductors carrying a source current (in which case Amperes become Ampere.turns). This can also be useful in order to save computational time in cases with a low frequency current and where the diffusion of the EM fields is a very fast process. This option is in contrast with the general case where the current density in a circuit is completed in accordance with the solver type defined in EMSOL of *EM_CONTROL. For example, if an eddy current solver is selected, the diffusion of the current in the circuit is taken into account.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |

| VARIABLE | | DESCRIPTION | |
|----------|------------|-------------|--|
| CIRCID | Circuit ID | | |

6-8 (EM) LS-DYNA R12

| VARIABLE | DESCRIPTION |
|----------|--|
| CIRCTYP | Circuit type: |
| | EQ.1: Imposed current vs time defined by a load curve. |
| | EQ.2: Imposed voltage vs time defined by a load curve. If a negative value is entered for LCID, its absolute value will refer to a DEFINE FUNCTION for a user defined circuit equation. If a DEFINE_FUNCTION is used, the following parameters are accepted: f(time,emdt,curr,curr1,curr2,pot1,pot2). emdt is the current timestep, curr,curr1 and ,curr2 refer to the current value at t, t-1 and t-2, respectfully and pot1, pot2 refer to the scalar potential at t-1 and t-2 respectfully. |
| | EQ.3 : R, L, C, V0 circuit. |
| | EQ.11: Imposed current defined by an amplitude A, frequency F and initial time t_0 : $I = A\sin[2\pi F(t - t_0)]$ |
| | EQ.12: Imposed voltage defined by an amplitude A, frequency F and initial time t_0 : $V = A\sin[2\pi F(t - t_0)]$ |
| | EQ.21: Imposed current defined by a load curve over one period and a frequency F |
| | EQ.22: Imposed voltage defined by a load curve over one period and a frequency F |
| LCID | Load curve ID for CIRCTYP = 1, 2, 21 or 22 |
| R/F | Value of the circuit resistance for CIRCTYP = 3 |
| | Value of the Frequency for CIRCTYP = 11, 12, 21 or 22. For CIRCTYP = 11 or 12, to have the frequency defined by a load curve function of time, a negative value can be entered, corresponding to the load curve ID. |
| L/A | Value of the circuit inductance for CIRCTYP = 3 Value of the Amplitude for CIRCTYP = 11 or 12. To have the amplitude defined by a load curve function of time, a negative value can be entered corresponding to the load curve ID. |
| C/t0 | Value of the circuit capacity for CIRCTYP = 3 Value of the initial time t0 for CIRCTYP = 11 or 12 |
| V0 | Value of the circuit initial voltage for CIRCTYP = 3 . |

LS-DYNA R12 6-9 (EM)

*EM_CIRCUIT

| VARIABLE | DE | SCRIPTION |
|----------|---|--|
| Т0 | Starting time for CIRCT run. | YPE = 3. Default is at the beginning of the |
| SIDCURR | | current. It uses the orientation given by nts. To use the opposite orientation, use a of the segment set id. |
| | CIRCTYP.EQ.1/11/21 | The current is imposed through this segment set |
| | CIRCTYP.EQ.3: | The current needed by the circuit equations is measured through this segment set. |
| SIDVIN | TYP.EQ.2/3/12/22 and | ut voltage or input current when CIRC-CIRCTYP.EQ 1/11/21 respectively. It is ted as going into the structural mesh, ation of the segment. |
| SIDVOUT | TYP = 2/3/12/22 and | ut voltage or output current when CIRC-CIRCTYP = $1/11/21$ respectively. It is ed as going out of the structural mesh, ation of the segment. |
| PARTID | Part ID associated to the to the circuit. | e Circuit. It can be any part ID associated |

Table 6-1. Correspondence between circuit type and card entries. "M" indicates mandatory, "M*" mandatory with exceptions (see Remark 1), "O" indicates optional, and "-" indicates ignored.

Remarks:

- 1. When defining a circuit with an imposed current (type 1, 11 or 21) in cases of a closed loop geometry (torus), SIDVIN and SIDVOUT cannot be defined and thus, only SIDCURR is necessary.
- 2. When defining a circuit with an imposed tension (type 2, 12, 22), it is possible to also define SIDCURR. This can be useful in circuits where various flow

LS-DYNA R12 6-11 (EM)

*EM_CIRCUIT

paths are possible for the current in order to force the entire current to go through SIDCURR.

3. Circuit types 21 and 22 are for cases where the periodic current/tension does not exactly follow a perfect sinusoidal. The user has to provide the shape of the current/tension over one period through a LCID as well as the frequency.

6-12 (EM) LS-DYNA R12

*EM_CIRCUIT_CONNECT

Purpose: This keyword connects several circuits together by imposing a linear constraint on the global currents of circuit pairs

$$c_1 i_1 + c_2 i_2 = 0.$$

This is especially useful for 2D axisymmetric models involving spiral or helical coils.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |

| Variable | CONID | CONTYPE | CIRC1 | CIRC2 | C1 | C2 | | |
| Туре | 1 | I | I | I | F | F | | |
| Default | none | none | none | none | none | none | | |

| VARIABLE | DESCRIPTION |
|----------|--|
| CONID | Id of the Circuit Connect |
| CONTYPE | Type of connection between circuits. For the moment, it is only possible to combine circuits by imposing a linear constraint on the global current (=1). |
| C1/C2 | Values of the linear constraints if CONTYPE = 1. |

LS-DYNA R12 6-13 (EM)

*EM_CIRCUIT_ROGO

Purpose: Define Rogowsky coils to measure a global current vs time through a segment set or a node set.

Include as many cards as needed. This input ends at the next keyword ("*") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|-------|---------|--------|---|---|---|---|
| Variable | ROGID | SETID | SETTYPE | CURTYP | | | | |
| Type | I | I | I | I | | | | |
| Default | 0 | 0 | 0 | 0 | | | | |

| VARIABLE | DESCRIPTION |
|----------|--|
| ROGID | Rogowsky coil ID |
| SETID | Segment or node set ID |
| SETTYPE | Type of set: |
| | EQ.1: Segment set |
| | EQ.2: Node set (not available yet) |
| CURTYP | Type of current measured: |
| | EQ.1: Volume current |
| | EQ.2: Surface current (not available yet) |
| | EQ.3: Magnetic field flow (B field times Area) |

Remarks:

1. An ASCII file "em_rogo_xxx", with xxx representing the rogoId, is generated for each *EM_CIRCUIT_ROGO card giving the value of the current or the magnetic field vs time.

6-14 (EM) LS-DYNA R12

*EM

*EM_CONTACT

Purpose: Optional card used for defining and specifying options on electromagnetic contacts between two sets of parts. Generally used with the *EM_CONTACT_RESISTANCE card. Fields left empty on this card default to the value of the equivalent field for the *EM_CONTROL_CONTACT keyword.

Contact Definition Cards. Include one card for each contact definition. This input ends at the next keyword ("*") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|--------|-------|-------|-------|------|------|------|------|
| Variable | CONTID | DTYPE | PSIDM | PSIDS | EPS1 | EPS2 | EPS3 | D0 |
| Туре | I | I | I | I | F | F | F | F |
| Default | none | 0 | none | none | 0.3 | 0.3 | 0.3 | None |

| VARIABLE | DESCRIPTION | |
|--------------|--|-----|
| CONTID | Electromagnetic contact ID | |
| DTYPE | Detection type (See Remark 2) EQ.0: Contact type 0 (Default). | |
| | EQ.1: Contact type 1. | |
| PSIDM | Master part set ID | |
| PSIDS | Slave part set ID | |
| EPS <i>i</i> | Contact Coefficients for contact detection conditions. discussion below. | See |
| D0 | Contact condition 3 when $COTYPE = 1$. | |

Remarks:

Contact is detected when all of the following three condition are satisfied:

1. Contact condition 1:

$$n_1. n_2 \leq -1 + \varepsilon_1$$

2. Contact condition 2:

LS-DYNA R12 6-15 (EM)

*EM_CONTACT

Figure 0-1. Contact detection conditions between two faces.

$$\begin{aligned} -\varepsilon_2 &\leq \alpha_1 \leq 1 + \varepsilon_2 \\ -\varepsilon_2 &\leq \alpha_2 \leq 1 + \varepsilon_2 \\ -\varepsilon_2 &\leq \alpha_3 \leq 1 + \varepsilon_2 \end{aligned}$$

With n_1 and n_2 the normal vectors of faces f_1 and f_2 respectfully and P the projection of point a_2 on face f_1 with $(\alpha_1, \alpha_2, \alpha_3)$ its local coordinates (See Figure 0-1).

- 3. Contact condition 3 depends on the contact type.
 - a) For contact type 0:

$$d \leq \varepsilon_3 S_1$$

where d is the distance between P and a_2 and where S_1 the minimum side length:

$$S_1 = \min[d(a_1, b_1), d(b_1, c_1), d(c_1, a_1)]$$

b) For contact type 1:

$$d \leq D_0$$

6-16 (EM) LS-DYNA R12

*EM_CONTACT_RESISTANCE

Purpose: Calculate the electric contact resistance of a previously defined EM contact in *EM_CONTACT.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|--------|-------|---|---------|---|---|---|

LS-DYNA R12 6-17 (EM)

Figure 6-2. Electrode coming into contact with workpiece (RSW application).

VARIABLE

DESCRIPTION

JHRTYPE

Indicates how the Joule heating calculated by the contact resistance shall be taken into account:

- EQ.0: No addition: The Joule heating calculated by the contact resistance is not taken into account.
- EQ.1: The Joule heating coming from the contact resistance is divided and distributed evenly among all elements neighboring the contact surface.

Remarks:

- 1. The parameters for the DEFINE_FUNCTION are :
 - a) time/emdt: current time and EM timestep.
 - b) arealoc/areatot: local area associated to each face in contact and total contact area.
 - c) ctdist: Contact distance between the two faces in contact.

6-18 (EM) LS-DYNA R12

*EM_CONTACT_SUBDOM

Purpose: Optional card used for defining a specific region where EM contact will be active. This allows saving some calculation time by limiting the contact search area. Must be used in conjunction with *EM_CONTROL_CONTACT.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |

| Default | 0 | 100 | none | 0 | | | 5000 | 5000 |

| VARIABLE | | DESCRIPTION |
|----------|--|-------------|
| | | |

EMSOL Electromagnetism solver selector:

EQ.-1: Turns the EM solver off after reading the EM keywords.

EQ.1: Eddy current solver.

EQ.2: Induced heating solver.

EQ.3: Resistive heating solver.

EQ.11: Electrophysiology monodomain.

EQ.12: Electrophysiology bidomain.

EQ.13: Electrophysiology monodmain coupled with bidomain.

NUMLS Number of local EM steps in a whole period for EMSOL = 2. Not used for EMSOL = 1. If a negative value is entered, it will give

NUMLS function of the macro time.

MACRODT Macro time step when EMSOL = 2.

DIMTYPE EM dimension type:

EQ.0: 3D solve.

EQ.1: 2D planar with 6-zero thickness shell elements.

EQ.3: 2D axisymmetric (Y axis only) with zero thickness elements.

NCYLFEM Number of electromagnetism cycles between the recalculation of FEM matrices. If a negative value is entered, then the absolute value will refer to a load curve giving NCYCLFEM function of

time.

LS-DYNA R12 6-21 (EM)

*EM_CONTROL

VARIABLE

DESCRIPTION

NCYLBEM

Number of electromagnetism cycles between the recalculation of BEM matrices. If a negative value is entered, then the absolute value will refer to a load curve giving NCYCLBEM function of time.

6-22 (EM) LS-DYNA R12

*EM_CONTROL_CONTACT

Purpose: This keyword activates the electromagnetism contact algorithms, which detects contact between conductors. Electromagnetic fields flow from one conductor to another when detected as in contact.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|--------|-------|-------|------|------|------|------|
| Variable | EMCT | CCONLY | CTYPE | DTYPE | EPS1 | EPS2 | EPS3 | D0 |
| Туре | I | I | 1 | I | F | F | F | F |
| Default | 0 | 0 | 0 | 0 | 0.3 | 0.3 | 0.3 | none |

VARIABLE

DESCRIPTION

EMCT

EM contact activation flag:

EQ.0: No contact detection

EQ.1: Contact detection

CCONLY

Determines on which parts of the model the EM contact should be activated.

EQ.0: Contact detection between all active parts associated with a conducting material. (Default)

EQ.1: Only look for EM contact between parts associated through the EM_CONTACT card. In some cases this option can reduce the calculation time.

CTYPE Contact type :

EQ.-1: Node to node contact based on constraints on the scalar potential. See Remark 1.

EQ.0: Node to node penalty based contact on the scalar potential.

EQ.1: Discrete mortar penalty contact on the scalar potential.

EQ.2: Continuous mortar penalty contact on the scalar potential and the vector potential (when active).

LS-DYNA R12 6-23 (EM)

| VARIABLE | DESCRIPTION |
|--------------|--|
| DTYPE | Detection type. If *EM_CONTACT is not defined, the solver will look for global contact options in *EM_CONTROL_CONTACT. |
| | EQ.0: Contact type 0 (Default). See *EM_CONTACT. |
| | EQ.1: Contact type 1. |
| EPS <i>i</i> | Global contact coefficients used if the equivalent fields in *EMCONTACT are empty. |
| D0 | Global contact condition 3 value when DTYPE = 1 |

Remarks:

- 1. In versions prior to R12, CTYPE = 0 was the default EM contact for the resistive heating solver while CTYPE = -1 was the default EM contact for the Eddy current solver. CTYPE = 1 and CYPE = 2 are the recommended contacts for best accuracy.
- 2. When the Eddy current solver is active, when contact occurs between BEM surfaces, the solver will automatically remove the faces that are on the contact surface and internally stitch the two BEM surfaces together in order to achieve a continuous closed BEM mesh.

6-24 (EM) LS-DYNA R12

*EM_CONTROL_COUPLING

Purpose: Allows the user to control couplings between various solvers with the EM solver.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|-------|--------|--------|---------|---------|---|---|
| Variable | THCPL | SMCPL | THLCID | SMLCID | THCPLFL | SMCPLFL | | |

| VARIABLE | DESCRIPTION |
|----------|--|
| THCPL | Coupling to the thermal solver. When turned on, the EM solver will transfer the Joule heating terms to the solid mechanics thermal solver. |
| | EQ.0: Coupling on. |
| | EQ.1: Coupling off. |
| SMCPL | Coupling to the solid mechanics solver. When turned on, the EM solver will transfer the Lorentz forces to the solid mechanics solver. |
| | EQ.0: Coupling on. |
| | EQ.1: Coupling off. |
| THLCID | Optional load curve ID. When defined, the heat rate transferred to the thermal solver will be scaled by the value returned by THLCID. |
| SMLCID | Optional load curve ID. When defined, the forces transferred to the solid mechanics solver will be scaled by the value returned by SMLCID. |
| THCPLFL | Coupling to the heat equation when EM quantities are solved on fluid elements. When turned on, the EM solver will transfer the Joule heating terms to the ICFD solver. |
| | EQ.0: Coupling off. |
| | EQ.1: Coupling on. |

LS-DYNA R12 6-25 (EM)

VARIABLE

DESCRIPTION

SMCPLFL

Interaction between the solid mechanics solver and the ICFD solver when EM quantities are solved on fluid elements.

- EQ.0: Default FSI. The fluid pressure will be passed to the solid mechanics solver.
- EQ.1: The fluid pressure is replaced by the electrostatic pressure.
- EQ.2: Both the fluid pressure and the electrostatic pressure are passed on to the solid mechanics solver.

6-26 (EM) LS-DYNA R12

*EM_CONTROL_EROSION

Purpose: Allows the EM solver to take eroded elements into account

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|---|---|---|---|---|---|---|
| Variable | ECTRL | | | | | | | |
| Туре | I | | | | | | | |

|-----|-----|-----|

DESCRIPTION

NCYLFEM

Number of electromagnetism cycles between the recalculation of FEM matrices. If a negative value is entered, then the absolute value will refer to a load curve giving NCYCLFEM function of time.

NCYLBEM

Number of electromagnetism cycles between the recalculation of BEM matrices. If a negative value is entered, then the absolute value will refer to a load curve giving NCYCLBEM function of time.

AUTOFEM

In addition to NCYLFEM, this triggers an automatic recomputation of the FEM matrices based on an error calculation of the conductors' relative deformation and electrical conductivity changes. See TOL1FEM and TOL2FEM.

EQ.0: Autorecomputation off.

EQ.1: Autorecomputation on.

AUTOBEM

In addition to NCYLBEM, this triggers an automatic recomputation of the BEM matrices based on an error calculation of the conductors' relative displacements. See TOL1BEM and TOL2BEM.

EQ.0: Autorecomputation off.

EQ.1: Autorecomputation on.

6-28 (EM) LS-DYNA R12

| VARIABLE | DESCRIPTION |
|----------|--|
| TOL1FEM | If a conducting element sees a deformation or a conductivity change that reaches an error higher than TOL1FEM, then the FEM matrices will be reassembled. If a negative value is entered, then the absolute value will refer to a load curve giving TOL1FEM function of time. |
| TOL2FEM | If TOL2FEM*Number-of-conducting-elements see a deformation or a conductivity change that reaches an error higher than TOL2FEM, then the FEM matrices will be recomputed. If a negative value is entered, then the absolute value will refer to a load curve giving TOL2FEM function of time. |
| TOL1BEM | If a conducting element sees a displacement that reaches an error higher than TOL1BEM, then the BEM matrices will be reassembled. If a negative value is entered, then the absolute value will refer to a load curve giving TOL1BEM function of time. |
| TOL2BEM | If TOL2BEM*Number-of-conducting-elements see a displacement that reaches an error higher than TOL2BEM, then the BEM matrices will be recomputed. If a negative value is entered, then the absolute value will refer to a load curve giving TOL2BEM function of time. |

LS-DYNA R12 6-29 (EM)

*EM_CONTROL_SWITCH

Purpose: It is possible to active a control "switch" that will shut down the solver based on a load curve information. LS-DYNA incorporates complex types of curves (See *DE-FINE_CURVE_FUNCTION) that allow the setting up of complex On/Off switches, for instance, by using a nodal temperature value.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |

| VARIABLE | DESCRIPTION |
|----------|---|
| TSTYPE | Time step type: |
| | EQ.1: constant time step given in DTCONST |
| | EQ.2: time step as a function of time given by a load curve specified in LCID |
| | EQ.3: automatic time step computation, depending on the solver type. This time step is then multiplied by FACTOR |
| DTCONST | Constant value for the time step for TSTYPE = 1 |
| LCID | Load curve ID giving the time step as a function of time for $TSTYPE = 2$ |
| FACTOR | Multiplicative factor applied to the time step for TSTYPE = 3 |
| TSMIN | Minimum time step. When TSMIN is defined, the EM time step cannot drop below TSMIN. A negative value will refer to a time dependent load curve. |
| TSMAX | Maximum time step. When TSMAX is defined, the EM time step cannot increase beyond TSMAX. A negative value will refer to a time dependent load curve. |
| RLCSF | RLC Circuit time step scale factor. See Remark 2. |
| MECATS | Mechanical time step handling in cases where the EM solver time step becomes smaller (see Remark 3): EQ.0: Default. The EM time step will go below the solid |
| | |

6-32 (EM) LS-DYNA R12

VARIABLE

DESCRIPTION

mechanics timestep, and several EM solves will occur between two solid mechanics time steps to ensure time consistency.

EQ.1: The solid mechanics time step will adapt and decrease to the EM time step value so that only one EM solve occurs between two solid mechanics solves.

Remarks:

1. **Eddy Current Solver Automatic Time Step.** For an eddy current solver, the automatic time step is based on the diffusion equation for the magnetic field:

$$\sigma \frac{\partial \vec{A}}{\partial t} + \vec{\nabla} \times \frac{1}{\mu} \vec{\nabla} \times \vec{A} + \sigma \vec{\nabla} \varphi = \vec{\jmath}_S \ .$$

It is computed as the minimal elemental diffusion time step over the elements. For a given element, the elemental diffusion time step is given as $dt_e = l_e^2/(2D)$, where:

- *D* is the diffusion coefficient $D = 1/(\mu_0 \sigma_e)$,
- σ_e is the element electrical conductivity,
- μ_0 is the permeability of free space,
- l_e is the minimal edge length of the element (minimal size of the element).
- 2. **Automatic Time Step with RLC Circuit.** When an automatic time step is defined and an RLC circuit is present, the EM solver will perform an additional check and calculate an approximation of the first current period based on a 0-D circuit solve. It will then limit the timestep by a factor $T_{\rm period}/(4 \times {\rm RLCSF})$. The default value of RLCSF ensures that 25 EM timesteps will be calculated for the first quarter period.
- 3. **MECATS.** In general, we recommend avoiding scenarios where the EM time step becomes smaller than the solid mechanics time step which are often the result of ill-defined input decks and parameters. This can, however, happen in cases where conducting elements have high deformations and an automatic EM time step is selected in which case you can choose between the two MECATS options.

LS-DYNA R12 6-33 (EM)

*EM_DATABASE_CIRCUIT

Purpose: This keyword enables the output of EM data for every circuit defined.

Output options card

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|-------|---|---|---|---|---|---|
| Variable | OUTLV | DTOUT | | | | | | |
| Туре | I | F | | | | | | |
| Default | 1 | 0. | | | | | | |

VARIABLE

DESCRIPTION

OUTLV

Determines if the output file should be dumped.

EQ.0: No output file is generated.

EQ.1: The output file is generated.

DTOUT

Time interval to print the output. If DTOUT is equal to 0.0, then the EM timestep will be used.

Remarks:

- 1. The file name for this database is em_circuit_XXX.dat with XXX the circuit ID.
- 2. ResistanceD is calculated in the following way:
 - a) A scalar potential difference of 1 is imposed at the circuit's boundaries SIDVIN and SIDVOUT.
 - b) The system to be solved at SIDCURR is then $\nabla^2 \varphi = 0$ with $\varphi_{\text{SIDVIN}} = 1$ and $\varphi_{\text{SIDVOUT}} = 0$. No diffusive effects are taken into account meaning that the current density can be written as $\mathbf{j} = \nabla \varphi$ and the total current as $I = \mathbf{j} \cdot \mathbf{n} dA$.
 - c) The resistance can then be estimated using $R_D = U/I$. The calculation of this R_D resistance is solely based on the circuit's geometry and conductivity. It is therefore equivalent to the resistance as commonly defined in the circuit equations:

$$R_D = L/\sigma S$$

6-34 (EM) LS-DYNA R12

where L is the length of the circuit and S its surface area.

- 3. Resistance J is calculated by using the data provided during the EM solve: $R_J = J/I^2$ where J and J are, respectively, the joule heating and the current. Compared with Resistance J is not so much a resistance calculation since it accounts for the resistive effects (when using the Eddy current solver). Rather, it corresponds to the resistance that the circuit would need in order to get the same Joule heating in the context of a circuit equation. If all EM fields are diffused or the RH solver is being used, Resistance J should be close to Resistance J.
- 4. Only the mutual inductances between the first three circuits defined are output.

LS-DYNA R12 6-35 (EM)

*EM_DATABASE_CIRCUIT0D

Purpose: This keyword enables the output of EM data for every circuit defined.

Output options card

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|-------|---|---|---|---|---|---|
| Variable | OUTLV | DTOUT | | | | | | |
| Туре | I | F | | | | | | |
| Default | 0 | 0. | | | | | | |

| VARIABLE | DESCRIPTION |
|----------|---|
| OUTLV | Determines if the output file should be dumped. |
| | EQ.0: No output file is generated. |
| | EQ.1: The output file is generated. |
| DTOUT | Time interval to print the output. If DTOUT is equal to 0.0, then the EM timestep will be used. |

Remarks:

- 1. The file name for this database is em_circuit0D_XXX.dat with XXX the circuit ID.
- 2. At the start of the run, based on the initial values of the meshes resistances and inductances, the solver will calculate the results for a so-called "0D" solution which does not take into account the current's diffusion, the part's displacements or the EM material property changes. It is therefore a crude approximation. This can be useful in some cases especially in R,L,C circuits if the users wishes to have an first idea of how the source current will behave.
- 3. Since the calculation of this 0D circuit can take time depending on the problems size, it should only be used in cases where the output results are useful to the comprehension of the analysis.
- 4. This card has no influence on the results of the EM run itself.

6-36 (EM) LS-DYNA R12

*EM_DATABASE_ELOUT

Purpose: This keyword enables the output of EM data on elements.

Output Options Card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|-------|---|---|---|---|---|---|
| Variable | OUTLV | DTOUT | | | | | | |
| Туре | I | F | | | | | | |
| Default | 0 | 0. | | | | | | |

Include as many cards as needed. This input ends at the next keyword ("*") card.

| Card 2 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|---|---|---|---|---|---|---|
| Variable | ELSID | | | | | | | |
| Туре | I | | | | | | | |
| Default | none | | | | | | | |

| VARIABLE | DESCRIPTION |
|----------|---|
| OUTLV | Determines if the output file should be dumped. |
| | EQ.0: No output file is generated. |
| | EQ.1: The output file is generated. |
| DTOUT | Time interval to print the output. If DTOUT is equal to 0.0, then the EM timestep will be used. |
| ELSID | Solid Elements Set ID. |

Remarks:

1. The file name for this database is em_elout.dat.

LS-DYNA R12 6-37 (EM)

*EM_DATABASE_FIELDLINE

Purpose: The EM solver uses a BEM method to calculate the EM fields between conductors. With this method, the magnetic field in the air or vacuum between conductors is therefore not explicitly computed. However, in some cases, it may be interesting to visualize some magnetic field lines for a better analysis. This keyword allows the output of field line data. It has no influence on the results of the EM solve.

Output Options Card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|-------|--------|---|---|---|---|
| Variable | FLID | PSID | DTOUT | NPOINT | | | | |

| Туре | I | | | | | | | |
| Default | 2 | | | | | | | |

6-38 (EM) LS-DYNA R12

| VARIABLE | DESCRIPTION |
|----------|--|
| FLID | Field line set ID |
| PSID | Point Set ID associated to the field line set (See *EM_POINT_SET). The coordinates given by the different points will be the starting points of the field lines. |
| DTOUT | Time interval to print the output. If DTOUT is equal to 0.0, then the EM time step will be used. |
| NPOINT | Number of points per field line. The points are regularly spaced. |
| INTEG | Type of numerical integrator used to compute the field lines : |
| | EQ.1: RK4, Runge Kutta 4. See Remark 2. |
| | EQ.2: DOP853, Dormand Prince 8(5,3). See Remark 2. |
| Н | Value of the step size. In case of an integrator with adaptive step size, it is the initial value of the step size. |
| HMIN | Minimal step size value. Only used in the case of an integrator with adaptive step size. |
| HMAX | Maximal step size value. Only used in the case of an integrator with adaptive step size. |
| TOLABS | Absolute tolerance of the integrator. Only used in the case of an integrator with adaptive step size. |
| TOLREL | Relative tolerance of the integrator. Only used in the case of an integrator with adaptive step size. |
| BTYPE | Method to compute the magnetic field : |
| | EQ.1: Direct method (every contribution is computed by the Biot Savart Law and summed up : very slow). |
| | EQ.2: Multipole method (approximation of the direct method using the multipole expansion). |
| | EQ.3: Multicenter method (approximation of the direct method using a weighted subset of points only in order to compute the magnetic field). |

LS-DYNA R12 6-39 (EM)

Remarks:

- 1. **File Names.** The file name for this database is em_fieldLine_XX_YYY.dat where XX is the field line ID and YYY is the point set ID defined in *EM_-POINT_SET.
- 2. **Integrators.** The Runge Kutta 4 integrator is an explicit iterative method for solving ODEs. It is a fourth order method with a constant step size. The Dormand Prince 8(5,3) integrator is an explicit iterative method for solving IDEs. Particularly, this integrator is an embedded Runge Kutta integrator of order 8 with an adaptive step size. This integrator allows a step size control which is done though an error estimate at each step. The Dormand Prince 8(5,3) is a Dormand Prince 8(6) for which the 6th order error estimator has been replaced by a 5th order estimator with 3rd order correction in order to make the integrator more robust.

6-40 (EM) LS-DYNA R12

*EM_DATABASE_GLOBALENERGY

Purpose: This keyword enables the output of global EM.

Output Options Card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |

VARIABLE

DESCRIPTION

OUTLV

Determines if the output file should be dumped.

EQ.0: No output file is generated.

EQ.1: The output file is generated.

Remarks:

1. The file name for this database is em_timestep.dat.

2. Outputs the run's EM tim estep versus the time step calculated using the EM CFL condition as criteria (autotimestep). This can be useful in cases with big deformations and/or material property changes and a fixed time step is being used in case that time step becomes to big compared to the stability time step.

6-46 (EM) LS-DYNA R12

*EM_EP_CELLMODEL_DEFINEFUNCTION

VARIABLE DESCRIPTION

MATID Material ID defined in the *MAT section

FSWITCH Switch for the ODE definition (see Remark 1):

EQ.0: functions EQ.1: derivatives

LS-DYNA R12 6-47 (EM)

| VARIABLE | DESCRIPTION |
|----------|---|
| NSTATE | Number of state variables u_1, u_2, \dots, u_n . The maximum value is 7 (see Cards 2 and 3). |
| DVDT | Function ID (see *DEFINE_FUNCTION) for evolution of V (function g in the equations in Remark 1). |
| DUiDT | Function ID (see *DEFINE_FUNCTION) for evolution of u_i (function f_i in the equations in Remark 1) |
| V0 | Function ID (see *DEFINE_FUNCTION) for initial value of $V(x,y,z)$ |
| Ui | Function ID (see *DEFINE_FUNCTION) for initial value of $u_i(x,y,z)$ |

Remarks:

- 1. This allows having a user defined cell model defined through define functions (See *DEFINE_FUNCTION). The model is composed of the transmembrane potential, V, along with n state variables $u_1, u_2, \dots u_n$. Their temporal evolution is given depending upon FSWITCH.
 - a) If FSWITCH = 0:

$$V(t) = g(t, dt, V(t-1), u_1(t-1), u_2(t-1), \dots, u_n(t-1))$$

$$u_1(t) = f_1(t, dt, V(t-1), u_1(t-1), u_2(t-1), \dots, u_n(t-1))$$

$$u_2(t) = f_2(t, dt, V(t-1), u_1(t-1), u_2(t-1), \dots, u_n(t-1))$$

$$\vdots$$

$$u_n(t) = f_n(t, dt, V(t-1), u_1(t-1), u_2(t-1), \dots, u_n(t-1))$$

b) If FSWITCH = 1:

$$\begin{split} \frac{\partial V(t)}{\partial t} &= g \Big(t, dt, V(t-1), u_1(t-1), u_2(t-1), \dots, u_n(t-1) \Big) \\ \frac{\partial u_1(t)}{\partial t} &= f_1 \Big(t, dt, V(t-1), u_1(t-1), u_2(t-1), \dots, u_n(t-1) \Big) \\ \frac{\partial u_2(t)}{\partial t} &= f_2 \Big(t, dt, V(t-1), u_1(t-1), u_2(t-1), \dots, u_n(t-1) \Big) \\ & \vdots \\ \frac{\partial u_n(t)}{\partial t} &= f_3 \Big(t, dt, V(t-1), u_1(t-1), u_2(t-1), \dots, u_n(t-1) \Big) \end{split}$$

2. **Benchmarks.** The electrophysiology benchmarks presented in:

6-48 (EM) LS-DYNA R12

[1] "Verification of computational models of cardiac electro-physiology", Pathmanathan P, Gray RA., Int J Numer Method Biomed Eng. 2014 May;30(5):525-44

can be done with this model.

LS-DYNA R12 6-49 (EM)

*EM_EP_CELLMODEL_FENTONKARMA

Purpose: Define an Fenton-Karma ionic cell model for Electro-Physiology.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |

| Variable | U0 | V0 | W0 | | | | | |
| Variable Type | U0 F | V0 F | W0 F | | | | | |

| VARIABLE | DESCRIPTION |
|----------|--|
| MATID | Material ID defined in *MAT |
| TAUD | Time constant τ_d described in Equation (5). |
| TAUR | Time constant τ_r described in Equation (6). |
| TAUSI | Time constant τ_{si} described in Equation (7). |
| TAU0 | Time constant τ_0 described in Equation (6). |
| TAUVP | Time constant τ_{vp} described in Equation (3). |
| TAUVM | Time constant τ_{vm} described in Equation (3). |
| TAUWP | Time constant τ_{wp} described in Equation (4). |
| TAUWM | Time constant τ_{wm} described in Equation (4). |
| UC | Threshold potential U_c for activation of $I_{\rm fi}$ in Equation (3, 4, 5, 6). |
| UCSI | Threshold potential U_c^{si} for activation of I_{si} in Equation (7). |
| K | Constant k in Equation (7). |
| U0/V0/W0 | Initial value of U,V,W. |
| | |

Remarks:

1. The Fenton-Karma model is a simplified ionic model with three membrane currents that approximates well the restitution properties and spiral wave behavior of more complex ionic models of cardiac action potential (Beeler-Reuter and others). It was introduced in [1]

$$I_{ion} = -C_m \frac{\partial V}{\partial t} = -J_{fi} \tag{1}$$

Where V is the transmembrane potential, C_m the specific capacitance of the cell membrane.

$$\frac{du}{dt} = -J_{fi} - -J_{fo} - J_{si} \tag{2}$$

LS-DYNA R12 6-51 (EM)

$$\frac{dv}{dt} = \frac{\Theta(u_c - u)(1 - v)}{\tau_{vm}} - \frac{\Theta(u - u_c)v}{\tau_{vp}}$$
(3)

$$\frac{dw}{dt} = \frac{\Theta(u_c - u)(1 - w)}{\tau_{wm}} - \frac{\Theta(u - u_c)w}{\tau_{wp}}$$
(4)

$$J_{fi} = -\frac{\Theta(u_c - u)(1 - u)(u - u_c)}{\tau_d}$$
 (5)

$$J_{so} = \frac{u \Theta(u_c - u)}{\tau_o} + \frac{u \Theta(u - u_c)}{\tau_r}$$
(6)

$$J_{si} = -\frac{w(1 + \tanh[k(u - u_c^{si}])}{2\tau_{si}}$$
 (7)

Where Θ is the Heaviside step function.

*EM_EP_CELLMODEL_FITZHUGHNAGUMO

Purpose: Define an Fitzhugh-Nagumo ionic cell model for Electro-Physiology.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|------|-------|------|------|------|---|---|
| Variable | MATID | | | | | | | |
| Type | I | | | | | | | |
| Default | none | | | | | | | |
| Card 2 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| Variable | ALPHA | BETA | GAMMA | С | MU1 | MU2 | | |
| Type | F | F | F | F | F | F | | |
| Default | none | none | none | none | none | none | | |
| Cond 0 | 4 | 0 | 2 | 4 | | 6 | 7 | 0 |
| Card 3 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| Variable | V | R | | | | | | |
| Туре | F | F | | | | | | |
| Default | none | none | | | | | | |

| VARIABLE | DESCRIPTION |
|----------|---|
| MATID | Material ID defined in *MAT |
| ALPHA | Excitation constant α described in Equation (1). |
| BETA | Excitation constant β described in Equation (2). |
| GAMMA | Excitation constant γ described in Equation (2). |
| С | Excitation constant c described in Equation (1). |

LS-DYNA R12 6-53 (EM)

| VARIABLE | DESCRIPTION |
|----------|--|
| MU1 | Excitation constant μ_1 described in Equation (2). |
| MU2 | Excitation constant μ_2 described in Equation (2). |
| V | Initial value of V. |
| R | Initial value of r . |

Remarks:

1. In the Fitzhugh-Nagumo model, the excitation is defined by a cubic polynomial along with one recovery variable, r. The transmembrane current reads :

$$I_{ion} = -C_m \frac{\partial V}{\partial t} = -cV (V - \alpha)(V - 1) - rV \tag{1}$$

Where V is the transmembrane potential, C_m the specific capacitance of the cell membrane and c and α are excitation constants.

The recovery variable r evolves according to :

$$\frac{dr}{dt} = (\gamma + \frac{r\mu_1}{\mu_2 + V})(-r - cV(V - \beta - 1))$$
 (2)

Where β , γ , μ_1 and μ_2 are excitation constants.

This is a model of the action potential of human ventricular cells that, while including a high level of electrophysiological detail, is computationally cost-effective enough to be

3.62 (EM) LS-DYNA Version 980

applied in large-scale spatial simulations for the study of reentrant arrhythmias. Please see the references for details. This model is based on [2].

|----------|--|
| C2 | C2 constant (no units) |
| C3 | C3 constant (no units) |
| C4 | C4 constant (no units) |
| K | Parameter k (no units). |
| EXPON | Exponent in equations (2) (see remarks) |
| LGTUNIT | Length units for UUS (relative to meter, i.e. = 1.e-3 if UUS in mm). |
| TIMUNIT | Time units for UUS (relative to seconds). |
| TEMUNIT | Temperature units |
| | EQ.1: temperature in Celsius |
| | EQ.2: temperature in Kelvins |
| ADJUST | Conductivity modification |
| | EQ.0: (default) The conductivity is given by the Burgess formula. |
| | EQ.1: The conductivity is adjusted so that it is equal to the conductivity defined in *EM_MAT card $\sigma_{\rm mat}$ at room temperature: |
| | $\sigma(\theta) = \sigma_{\text{Burgess}}(\theta) \frac{\sigma_{\text{mat}}}{\sigma_{\text{Burgess}}(\theta_{\text{room}})}$ |

Remarks:

1. The Burgess model gives the electrical resistivity vs temperature and density for the solid phase, liquid phase and vapor phase. At this time, only the solid and liquid phases are implemented. To check which elements are in the solid and in the liquid phase, a melting temperature is first computed by:

$$\theta_{m} = \theta_{m,0} \left(\frac{V}{V_{0}}\right)^{-\frac{1}{3}} e^{(2\gamma_{0}-1)(1-\frac{V}{V_{0}})}$$

a) If $T < \theta_m$: solid phase model applies.

The solid phase electrical resistivity corresponds to the Meadon model:

LS-DYNA R12 6-65 (EM)

$$\eta_S = \left(C_1 + C_2 \theta^{C_3}\right) f_c \left(\frac{V}{V_0}\right),\tag{1}$$

where θ is the temperature, V is the specific volume, and V₀ is the reference specific volume (zero pressure, solid phase). In (1), the volume dependence is given by:

$$f_c\left(\frac{V}{V_0}\right) = \begin{cases} \left(\frac{V}{V_0}\right)^{2\gamma - 1} & \text{EXPON.EQ.} - 1 & \text{(most materials)} \\ \left(\frac{V}{V_0}\right)^{2\gamma + 1} & \text{EXPON.EQ.} + 1 & \text{(tungsten)} \\ \left(\frac{V}{V_0}\right)^{2\gamma} & \text{EXPON.EQ.} 0 & \text{(stainless steel)} \end{cases}$$
 (2)

with

$$\gamma = \gamma_0 - \left(\gamma_0 - \frac{1}{2}\right) \left(1 - \frac{V}{V_0}\right) \tag{3}$$

b) If $T > \theta_{m}$: liquid phase model:

$$\eta_L = (\eta_L)_{\theta_m} \left(\frac{\theta}{\theta_m}\right)^{C_4} \tag{4}$$

with

$$(\eta_L)_{\theta_m} = \Delta \eta (\eta_S)_{\theta_m}$$

where

$$\Delta \eta = \begin{cases} ke^{0.69L_F/\theta_m} & k > 0\\ 1 + 0.0772(2 - \theta_m) & k = -1\\ 1 + 0.106(0.846 - \theta_m) & k = -2 \end{cases}$$
 (tungsten) (5)

The following table reports some sets of parameters given by Burgess in his paper:

| Parameter | Cu | Ag | Au | W | A1(2024) | SS(304) |

| C2 | C2 constant (no units) |
| C3 | C3 constant (no units) |
| TEMUNIT | Temperature units EQ.1: temperature in Celsius EQ.2: temperature in Kelvins |
| | - |

3.68 (EM) LS-DYNA Version 980

| VARIABLE | DESCRIPTION | | | | | | |
|----------|--|--|--|--|--|--|--|
| V0 | Reference specific volume V0 (UUS). | | | | | | |
| GAMMA0 | Reference Gruneisen value γ₀.(no units). | | | | | | |
| EXPON | Exponent in equations (7) | | | | | | |
| LGTUNIT | Length units for UUS (relative to meter, i.e. = 1.e-3 if UUS in mm). | | | | | | |
| TIMUNIT | Time units for UUS (relative to seconds). | | | | | | |
| ADJUST: | EQ.0: (default) the conductivity is given by the Burgess formula. | | | | | | |
| | EQ.1: The conductivity is adjusted so that it is equal to the conductivity defined in the *EM_MAT card $\sigma_{\rm mat}$ at room temperature: | | | | | | |
| | $\sigma(\theta) = \sigma_{\text{Burgess}}(\theta) \frac{\sigma_{\text{mat}}}{\sigma_{\text{Burgess}}(\theta_{\text{room}})}$ | | | | | | |

Remarks:

1. The Meadon model is a simplified Burgess model with the solid phase equations only.

The electrical resistivity is given by:

$$\eta_S = \left(C_1 + C_2 \theta^{C_3}\right) f_c \left(\frac{V}{V_0}\right) \tag{6}$$

where θ is the temperature, V is the specific volume, and V₀ is the reference specific volume (zero pressure, solid phase).

In (6), the volume dependence is given by:
$$f_c\left(\frac{V}{V_0}\right)^{2\gamma-1} \quad \text{EXPON.EQ.} -1 \qquad \text{(most materials)}$$

$$f_c\left(\frac{V}{V_0}\right) = \begin{cases} \left(\frac{V}{V_0}\right)^{2\gamma+1} & \text{EXPON.EQ.} +1 & \text{(tungsten)} \\ \left(\frac{V}{V_0}\right)^{2\gamma} & \text{EXPON.EQ.0} & \text{(stainless steel)} \\ 1 & \text{VO.EQ.0} & \text{(default value for } V_0 \text{ is zero)} \end{cases}$$

(In this last case, only EOSID, C1, C2, C3, TEMUNIT, TIMUNIT and LGTUNIT need to be defined)

LS-DYNA R12 6-69 (EM) with,

$$\gamma = \gamma_0 - \left(\gamma_0 - \frac{1}{2}\right) \left(1 - \frac{V}{V_0}\right) \tag{8}$$

The following table reports some sets of parameters given by Burgess in his paper:

| Parameter | Cu | Ag | Au | W | A1(2024) | SS(304) |
|--------------------------------------|----------|----------|----------|----------|----------|---------|

| LCID | Load curve ID. | |

Remarks:

1. The load curve describes the electrical conductivity (ordinate) vs the temperature (abscissa). The user needs to make sure the temperature and the electrical conductivity given by the load curve are in the correct units. Also, it is advised to give some bounds to the load curve (conductivities at very low and very high temperatures) to avoid bad extrapolations of the conductivity if the temperature gets out of the load curve bounds.

3.72 (EM) LS-DYNA Version 980

*EM_EOS_TABULATED2

Purpose: Define the electrical conductivity as a function of time by using a load curve.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|------|-------|---|---|---|---|---|
| Variable | EOSID | LCID | IFLAG | | | | | |
| Туре | I | I | I | | | | | |
| Default | none | none | 0 | | | | | |

| VARIABLE | DESCRIPTION |
|----------|--|
| EOSID | ID of the EM_EOS |
| LCID | Load curve ID, Define Function ID, Table ID or Table 2D ID. |
| IFLAG | Only used is a Table ID or a Table 2D ID is given in LCID EQ.0: Gives load curve ID function of temperature. Load curves give conductivity function of material's density. |
| | EQ.1: Gives load curve ID function of material's density. Load curves give conductivity function of temperature. |

Remarks:

- 1. The load curve describes the electrical conductivity (ordinate) vs the time (abscissa). The user needs to make sure the time and the electrical conductivity given by the load curve are in the correct units. Also, it is advised to give some bounds to the load curve (conductivities at t = 0 at after a long time) to avoid bad extrapolations of the conductivity if the run time gets out of the load curve bounds.
- 2. LCID can also refer to a DEFINE FUNCTION. If a DEFINE_FUNCTION is used, the following parameters are allowed: f(vx, vy, vz, temp, pres, vol, mass, Ex, Ey, Ez, Bx, By, Bz, Fx, Fy, Fz, JHrate, time). Fx, Fy, Fz refers to the Lorentz force vector.

LS-DYNA R12 6-73 (EM)

*EM_EXTERNAL_FIELD

Purpose: Define the components of a time dependent exterior field uniform in space applied on the conducting parts.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|---------|-------|------|-------|-------|-------|---|---|
| Variable | FIELDID | FTYPE | FDEF | LCIDX | LCIDY | LCIDZ | | |
| Туре | I | I | F | I | 1 | 1 | | |
| Default | 0 | 0 | 0 | 0 | 0 | 0 | | |

FIELDID External Field ID

FTYPE Field type:

EQ.1: magnetic field

EQ.2: electric field (not available yet)

EQ.3: charge density (resistive heating solver only)

FDEF Field defined by:

EQ.1: load curves

EQ.2: define function (FTYPE = 3 only). If a define function is used, the following parameters are accepted: x, y, z, time emdt not curr sigma

time, emdt, pot, curr, sigma.

LCID[X,Y,Z] Load curve ID defining the (X,Y,Z) component of the field

function of time for FTYPE = 1. For FTYPE = 3, only LCIDY is used and should be a simple a load curve or define function ID.

Remarks:

1. **Electrostatic Problems.** FTYPE = 3 is mostly used in electrostatic problem configurations. The material's conductivity then represents the permittivity.

3.74 (EM) LS-DYNA Version 980

*EM_ISOPOTENTIAL

Purpose: Defining an isopotential, i.e. constrain nodes so that they have the same scalar potential value. This card is to be used with the EM solver of type 3.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |

VARIABLE DESCRIPTION

CONID Connection ID

CONTYPE Connection type:

EQ.1: Short Circuit.

EQ.2: Resistance.

EQ.3: Voltage Source.

EQ.4: Current Source.

EQ.5: Meshless Randles circuit (used to represent a cell by one

lumped Randles circuit)

EQ.6: R, L, C circuit

ISOID1 ID of the first isopotential to be connected

| VARIABLE | DESCRIPTION |
|----------------|---|
| ISOID2 | Optional ID of the second isopotential to be connected |
| VAL | Value of the resistance, voltage or current depending on CON-TYPE Ignored if LCID defined. |
| LCID /RDLID | Load curve ID defining the value of the resistance, voltage or current function of time. If a negative value is entered, a *DE-FINE_FUNCTION will be expected. The following parameters are allowed: (time, emdt, curr1, curr2, pot1, pot2, rmesh). Pot1 and pot2 or curr1, curr2 are the potential and current at the previous timestep and two previous timesteps ago. Rmesh is the mesh resistance calculated by the solver at this isopot. ID of the Randles circuit defined by *EM_RANDLES_MESHLESS if CONTYPE = 5. |
| PSID | Used for the application: meshless Randles circuit (CON-TYPE = 5) if the variable R0TOTH of *EM_RANDLES_MESH-LESS is equal to 1. Part Set ID where the joule heating corresponding to the resistance r0 in *EM_RANDLES_MESHLESS is added, averaged over the part set. |
| L/C/V0 | Circuit inductance, capacity and initial voltage. Resistance is given by VAL. |

LS-DYNA R12 6-77 (EM)

*EM_ISOPOTENTIAL_ROGO

Purpose: measures the total current flowing through a given section of the conductor and outputs it in an ASCII file called em_rogoCoil.dat

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |

VARIABLE DESCRIPTION

ISOID ID of the Rogo coil.

SETTYPE Set type:

EQ.1: Segment Set.

SETID Set ID

*EM_MAT_001

Purpose: Define the electromagnetic material type and properties for a material whose permeability equals the free space permeability.

Include as many cards as needed. This input ends at the next keyword ("*") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|-------|-------|-------|---|---|--------|---------|
| Variable | MID | MTYPE | SIGMA | EOSID | | | DEATHT | RDLTYPE |
| Type | I | I | F | I | | | F | I |
| Default | none | none | none | none | | | 1.E28 | none |

| VARIABLE | DESCRIPTION |
|----------|---|
| MID | Material ID: refers to MID in the *PART card. |
| MTYPE | Defines the electromagnetism type of the material: |
| | EQ.0: Air or vacuum |
| | EQ.1: Insulator material: these materials have the same electromagnetism behavior as EQ.0 |
| | EQ.2: Conductor carrying a source. In these conductors, the eddy current problem is solved, which gives the actual current density. Typically, this would correspond to the coil. |
| | EQ.3: Fluid conductor. In that case, MID refers to the ID given in *ICFD_PART. See Remark 1. |
| | EQ.4: Conductor not connected to any current or voltage source, where the Eddy current problem is solved. Typically, this would correspond to the workpiece |
| SIGMA | Initial electrical conductivity of the material |
| EOSID | Optional ID of the EOS to be used for the electrical conductivity (see *EM_EOS cards). |

LS-DYNA R12 6-79 (EM)

| VARIABLE | DESCRIPTION |
|----------|--|
| DEATHT | Death time for the material. After DEATHT, the material will no longer be considered a conductor and removed from the EM solve. If a negative value is entered, a *DEFINE_FUNCTION will be expected. The following parameters are allowed: (vx, vy, vz, temp, vol, mass, Ex, Ey, Ez, Bx, By, Bz, Fx, Fy, Fz, JHrate, time) . Fx, Fy, Fz refers to the Lorentz force vector. A negative value returned by the *DEFINE_FUNCTION corresponds to a 'dead' or inactive element. Once an element has been removed from the EM solve, it cannot return. |
| RDLTYPE | Used for the application: composite Tshell battery, with *EMRANDLES_TSHELL . Defines the function of the layer associated to MID: |
| | EQ.1: Current Collector Positive |
| | EQ.2: Positive Electrode |
| | EQ.3: Separator |
| | EQ.4: Negative Electrode |
| | EQ.5: Current Collector Negative |

Remarks:

1. Only the resistive heating solver is currently available when coupling the ICFD solver with the EM solver (see *EM_CONTROL).

3.80 (EM) LS-DYNA Version 980

*EM_MAT_002

Purpose: Define an electromagnetic material type and properties whose permeability is different than the free space permeability.

Include as many cards as needed. This input ends at the next keyword ("*") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |

| | EQ.1: Insulator material. These materials have the same electromagnetism behavior as EQ.0 |
| | EQ.2: Conductor carrying a source. In these conductors, the eddy current problem is solved, which gives the actual current density. Typically, this would correspond to the coil. |
| | EQ.4: Conductor not connected to any current or voltage source, where the Eddy current problem is solved. Typically, this would correspond to the workpiece |
| SIGMA | Initial electrical conductivity of the material |
| EOSID | ID of the EOS to be used for the electrical conductivity (see *EMEOS cards). |
| MUREL | Relative permeability: Is the ratio of the permeability of a specific medium to the permeability of free space ($\mu_r = \mu/\mu_0$) |
| EOSMU | ID of the EOS to be used to define the behavior of μ by an equation of state (Note: if EOSMU is defined, MUREL will be used for the initial value only). |

LS-DYNA R12 6-81 (EM)

VARIABLE

DESCRIPTION

DEATHT

Death time for the material. After DEATHT, the material will no longer be considered a conductor and removed from the EM solve. If a negative value is entered, a *DEFINE_FUNCTION will be expected. The following parameters are allowed: (vx, vy, vz, temp, vol, mass, Ex, Ey, Ez, Bx, By, Bz, Fx, Fy, Fz, JHrate, time) . Fx, Fy, Fz refers to the Lorentz force vector. A negative value returned by the *DEFINE_FUNCTION corresponds to a 'dead' or inactive element. Once an element has been removed from the EM solve, it cannot return.

3.82 (EM) LS-DYNA Version 980

Purpose: Define an electromagnetic material type whose electromagnetic conductivity is defined by a (3*3) tensor matrix. Applications include composite materials.

VARIABLE

DESCRIPTION

MID

Material ID: refers to MID in the *PART card.

LS-DYNA R12 6-83 (EM)

MTYPE Defines the electromagnetism type of the material:

EQ.0: Air or vacuum

EQ.1: Insulator material:These materials have the same electromagnetism behavior as EQ.0

EQ.2: Conductor carrying a source. In these conductors, the eddy current problem is solved, which gives the actual current density. Typically, this would correspond to the coil. It is also where the monodomain equations are solved for EMSOL = 11 or EMSOL = 13.

EQ.4: Conductor not connected to any current or voltage source, where the Eddy current problem is solved. Typically, this would correspond to the workpiece.

SIGMA11 The 1, 1 term in the 3×3 electromagnetic conductivity tensor matrix. Note that 1 corresponds to the *a* material direction

SIGMA12 The 1, 2 term in the 3×3 electromagnetic conductivity tensor matrix. Note that 2 corresponds to the b material direction

: :

SIGMA33 The 3, 3 term in the 3×3 electromagnetic conductivity tensor matrix.

Define AOPT for both options:

AOPT Material axes option, see the figure in *MAT_002.

EQ.0.0: locally orthotropic with material axes determined by element nodes as shown in part (a) the figure in *MAT_002. The a-direction is from node 1 to node 2 of the element. The b-direction is orthogonal to the a-direction and is in the plane formed by nodes 1, 2, and 4.

EQ.1.0: locally orthotropic with material axes determined by a point in space and the global location of the element center; this is the a-direction.

EQ.2.0: globally orthotropic with material axes determined by vectors defined below, as with *DEFINE_COORDINATE_VECTOR.

EQ.3.0: locally orthotropic material axes determined by rotating the material axes about the element normal by an angle, BETA, from a line in the plane of the element

3.84 (EM) LS-DYNA Version 980

defined by the cross product of the vector v with the element normal. The plane of a solid element is the midsurface between the inner surface and outer surface defined by the first four nodes and the last four nodes of the connectivity of the element, respectively.

EQ.4.0: locally orthotropic in cylindrical coordinate system with the material axes determined by a vector v, and an originating point, P, which define the centerline axis. This option is for solid elements only.

EQ.5.0: globally defined reference frame with (a,b,c)=(X0,Y0,Z0).

XP, YP, ZP Define coordinates of point \mathbf{p} for AOPT = 1 and 4.

A1, A2, A3 Define components of vector \mathbf{a} for AOPT = 2.

MACF Material axes change flag for solid elements:

EQ.1: No change, default,

V1, V2, V3 Define components of vector \mathbf{v} for AOPT = 3 and 4.

D1, D2, D3 Define components of vector \mathbf{d} for AOPT = 2.

Remarks:

This card works in a similar way to *MAT_002.

The procedure for describing the principle material directions is explained for solid elements for this material model. We will call the material direction the **a-b-c** coordinate system. The AOPT options illustrated in the AOPT figure of *MAT_002 can define the **a-b-c** system for all elements of the parts that use the material.

LS-DYNA R12 6-85 (EM)

*EM_MAT_004

Purpose: Define the electromagnetic material type and properties for conducting shells in a 3D problem or in a 2D resistive heating problem.

Include as many cards as needed. This input ends at the next keyword ("*") card.

VARIABLE

DESCRIPTION

MID

Material ID: refers to MID in the *PART card.

MTYPE

Defines the electromagnetism type of the material:

EQ.0: Air or vacuum

EQ.1: Insulator material: these materials have the same electromagnetism behavior as EQ.0.

EQ.2: Material where the bidomain equations will be solved for EMSOL = 12 or EMSOL = 13.

EQ.5: Material associated to *EM_RANDLES_BATMAC

SIGMAXXA/B

The 1, 1 term in the 3×3 electromagnetic conductivity tensor matrix for the two conductivities. For the batmac model, A is for the potential on the positive current collector, B is for the potential on the negative current collector. For the bidomain model in Electrophysiology, A is for the intracellular potential, B for the extracellular potential.

SIGMAXYA/B

The 1, 2 term in the 3×3 electromagnetic conductivity tensor matrix for the two conductivities. Note that 2 corresponds to the b material direction

: :

SIGMAZZA/B

The 3, 3 term in the 3×3 electromagnetic conductivity tensor

3.88 (EM) LS-DYNA Version 980

matrix for the two conductivities.

Define AOPT for both options:

AOPT Material axes option, see the figure in *MAT_002.

- EQ.0.0: locally orthotropic with material axes determined by element nodes as shown in part (a) the figure in *MAT_002. The a-direction is from node 1 to node 2 of the element. The b-direction is orthogonal to the a-direction and is in the plane formed by nodes 1, 2, and 4.
- EQ.1.0: locally orthotropic with material axes determined by a point in space and the global location of the element center; this is the a-direction.
- EQ.2.0: globally orthotropic with material axes determined by vectors defined below, as with *DEFINE_COORDINATE_VECTOR.
- EQ.3.0: locally orthotropic material axes determined by rotating the material axes about the element normal by an angle, BETA, from a line in the plane of the element defined by the cross product of the vector v with the element normal. The plane of a solid element is the midsurface between the inner surface and outer surface defined by the first four nodes and the last four nodes of the connectivity of the element, respectively.
- EQ.4.0: locally orthotropic in cylindrical coordinate system with the material axes determined by a vector v, and an originating point, P, which define the centerline axis. This option is for solid elements only.
- EQ.5.0: globally defined reference frame with (a,b,c)=(X0,Y0,Z0).

XP, YP, ZP Define coordinates of point \mathbf{p} for AOPT = 1 and 4.

A1, A2, A3 Define components of vector \mathbf{a} for AOPT = 2.

MACF Material axes change flag for solid elements:

EQ.1: No change, default,

V1, V2, V3 Define components of vector \mathbf{v} for AOPT = 3 and 4.

LS-DYNA R12 6-89 (EM)

D1, D2, D3 Define components of vector \mathbf{d} for AOPT = 2.

Remarks:

1.When this material is used in conjunction with the battery BatMac model, then the conductivities must be adjusted by the current collector thickness ratio over the total thickness of the cell. For example, if n_p is the number of positive current collectors, t_p the thickness of each individual positive current collector and Th the total thickness of the cell, then the conductivity for the positive current collector must be scaled by : $\frac{n_p \times t_p}{Th}$.

2.This card works in a similar way to *MAT_002:

The procedure for describing the principle material directions is explained for solid elements for this material model. We will call the material direction the **a-b-c** coordinate system. The AOPT options illustrated in the AOPT figure of *MAT_002 can define the **a-b-c** system for all elements of the parts that use the material.

3.90 (EM) LS-DYNA Version 980

*EM_MAT_006

Purpose: Define two conductivities per EM node for special applications (Randles Batmac).

Include as many cards as needed. This input ends at the next keyword ("*") card.

LS-DYNA R12 6-95 (EM)

*EM_POINT_SET

| VARIABLE | DESCRIPTION |
|----------|--|
| POS | Position flag (for 2D see Remark 1): |
| | EQ.0 (default): The solver determines if the point is inside or outside of the conductors. |
| | EQ.1: Point outside of the conductors during the entire simulation. The solver does not check; hence a gain in computation time. |

Remarks:

1. If using *EM_2DAXI notice that the conductors represents the corresponding 3D conductors.

3.96 (EM) LS-DYNA Version 980

*EM_RANDLES_BATMAC

Purpose: define the distributed Randles circuit parameters for a Randles cell when using the batmac model. The batmac model is a macro battery model where solid elements are retained for the solid mechanics and thermal solve and where each conducting node will have its own Randles circuit associated to it. Must be used with *EM_MAT_006 or *EM_MAT_005.

VARIABLE DESCRIPTION

RDLID ID of the Randles Cell

RDLTYPE Type of Randles Cell:

EQ.-1: User defined equivalent circuit model. See Remark 3.

EQ.0: 0-order Randles Cell

EQ.1: 1-order Randles Cell

| VARIABLE | DESCRIPTION | | | | | | |
|-------------------|---|--|--|--|--|--|--|
| | EQ.2: 2-order Randles Cell | | | | | | |
| | EQ.3: 3-order Randles Cell | | | | | | |
| PSID | Part Set ID of all the parts composing the cell | | | | | | |
| RDLAREA | Randles Area: | | | | | | |
| | EQ.1: The parameters are per unit area and will be scaled in each Randle circuit by a factor depending on the local area of the circuit. Unit consistency in S.I: Ohms times square meters. | | | | | | |
| | EQ.2: Default. The parameters are defined for the whole cell and will be scaled in each Randle circuit by a factor depending on the local area of the circuit and the global area of the cell. Unit consistency in S.I: Ohms. | | | | | | |
| | EQ.3: The parameters are not scaled by area factors. Unit consistency in S.I: Ohms. | | | | | | |
| Q | Cell capacity. | | | | | | |
| CQ | SOC conversion factor (%/s), known to be equal to 1/36 in S.I units. | | | | | | |
| SOCINIT | Initial state of charge of the cell. | | | | | | |
| SOCTOU | Equilibrium voltage (OCV): | | | | | | |
| | GE.0.0: constant value | | | | | | |
| | LT.0.0: SOCTOU is a load curve ID defining equilibrium voltage (OCV) as a function of the state of charge (SOC). | | | | | | |
| R0CHA/ | $r_0/r_{10}/c_{10}$ when the current flows in the charge direction: | | | | | | |
| R10CHA/ | GE.0.0: constant value | | | | | | |
| C10CHA | LT.0.0: absolute value is a define function or table ID. See Remark 4 for the accepted define function arguments. For a define table, the circuit parameters can be made function of the SOC and temperature. | | | | | | |
| R0DIS/ | $r_0/r_{10}/c_{10}$ when the current flows in the discharge direction: | | | | | | |
| R10DIS/ C10DIS | GE.0.0: constant value. | | | | | | |
| | LT.0.0: absolute value is a define function or table ID. See | | | | | | |

LS-DYNA R12 6-99 (EM)

| VARIABLE | DESCRIPTION |
|--------------------|---|
| | Remark 4 for the accepted define function arguments. For a define table, the circuit parameters can be made function of the SOC and temperature. |
| R20CHA/ R30CHA/ | $r_{20}/r_{30}/c_{20}/c_{30}$ when the current flows in the charge direction: GE.0.0: constant value. |
| C20CHA/ | |
| С30СНА | LT.0.0: absolute value is a define function or table ID. See Remark 4 for the accepted define function arguments. For a define table, the circuit parameters can be made function of the SOC and temperature. |
| R20DIS/ | $r_{20}/r_{30}/c_{20}/c_{30}$ when the current flows in the discharge direction: |
| R30DIS/ C20DIS/ | GE.0.0: constant value. |
| C30DIS | LT.0.0: absolute value is a define function or table ID. See Remark 4 for the accepted define function arguments. For a define table, the circuit parameters can be made function of the SOC and temperature. |
| TEMP | Constant temperature value used for the Randles circuit parameters in case there is no coupling with the thermal solver (FRTHER $= 0$) |
| FRTHER | From Thermal: |
| | EQ.0: The temperature used in the Randles circuit parameters is TEMP |
| | EQ.1: The temperature used in the Randles circuit parameter is the temperature from the thermal solver. |
| R0TOTH | r_0 to thermal: |
| | EQ.0: The joule heating in the resistance r0 is not added to the thermal solver |
| | EQ.1: The joule heating in the resistance r0 is added to the thermal solver |
| DUDT | If negative integer, load curve ID of the reversible heat as a function of SOC. |
| TEMPU | Temperature unit: |
| | EQ.0: The temperature is in Celsius |

3.100 (EM) LS-DYNA Version 980

| VARIABLE | DESCRIPTION |
|----------|--|
| | EQ.1: The Temperature is in Kelvin |
| USESOCS | Use SOC shift (See Remark 2): |
| | EQ.0: Don't use the added SOCshift |
| | EQ.1: Use the added SOCshift |
| TAU | Damping time in the SOCshift equation. |
| FLCID | Load curve giving $f(i)$ where i is the total current in the unit cell |

Remarks:

- 1. **Model combinations.** The batmac model cannot be mixed with the solid or thick shell Randles models. It can however be used in conjunction with the meshless model.
- 2. **Accounting for Diffusion Limitations.** Sometimes, an extra term called SOCshift (or SocS) can be added at high rate discharges to account for diffusion limitations. The SOCshift is added to SOC for the calculation of the OCV u(SOC + SOCshift) and $r_0(SOC + SOCshift)$. SOCshift satisfies the following equation:

$$\frac{d(SOCshift)}{dt} + \frac{SOCshift}{\tau} = \frac{f(i(t))}{\tau}$$

with SOCshift(t = 0) = 0.

- 3. **User defined ECMs.** Randles circuits are based on the finite element Robin boundary condition, acting similarly to a convection boundary condition for the heat equation. As such, the circuit equation is decomposed into a term that will enter the left-hand-side of the stiffness matrix and a term that will be added to the right-hand-side. Changing the definition of those terms allows the user to replace the Randles circuits by any type of Equivalent Circuit model (ECM). This is the purpose of RDLTYPE=-1 where the term entering the l.h.s is defined by a negative integer referring to a *DEFINE_FUNCTION ID in ROCHA (unit consistency: Resistance) while a negative integer in R0DIS, associated to a *DEFINE_FUNCTION will give the term entering in the r.h.s (unit consistency: current).
- 4. **DEFINE FUNCTION**. Variables available in EM_RANDLES keywords for a *DEFINE_FUNCTION:

|----------|----------|---------|---|---|---|---|---|---|
| Variable | AREATYPE | FUNCTID | | | | | | |
| Туре | I | 1 | | | | | | |
| Default | none | none | | | | | | |

VARIABLE

DESCRIPTION

AREATYPE

Works the same way as RDLAREA in *EM_RANDLES_SOLID or in *EM_RANDLES_TSHELL:

- EQ.1: The heat source in FUNCTID is per unit area so that, for each local Randles circuit, the result returned by FUNCTID is multiplied by a factor areaLoc (areaLoc is the local area associated to each Randles circuit while areaGlob is the area of the whole cell) ($W.m^2$).
- EQ.2: Default. The heat source in FUNCTID is for the whole cell (the whole cell is shorted), so that, for each Randles circuit, the result returned by FUNCTID is multiplied by a factor areaLoc/areaGlob (W).
- EQ.3: The heat source returned by FUNCTID is taken as is in each Randles circuit (W).

FUNCTID

DEFINE_FUNCTION ID giving the local heat source function of local parameters for the local Randles circuit. See Remark 1.

Remarks:

RDLID ID of the Randles Cell

| VARIABLE | DESCRIPTION | | | |
|-------------------|---|--|--|--|
| RDLTYPE | Type of Randles Cell | | | |
| | EQ.0: 0-order Randles Cell. | | | |
| | EQ.1: 1-order Randles Cell. | | | |
| | EQ.2: 2-order Randles Cell. | | | |
| | EQ.3: 3-order Randles Cell. | | | |
| Q | Cell capacity. | | | |
| CQ | SOC conversion factor ($\%$ /s), known to be equal to 1/36 in S.I units. | | | |
| SOCINIT | Initial state of charge of the cell. | | | |
| SOCTOU | Equilibrium voltage (OCV): | | | |
| | GE.0.0: constant value | | | |
| | LT.0.0: SOCTOU is a load curve ID defining equilibrium voltage (OCV) as a function of the state of charge (SOC). | | | |
| R0CHA/ | $r_0/r_{10}/c_{10}$ when the current flows in the charge direction: | | | |
| R10CHA/ | GE.0.0: constant value | | | |
| C10CHA | LT.0.0: absolute value is a define function or table ID. See Remark 3 for the accepted define function arguments. For a define table, the circuit parameters can be made function of the SOC and temperature. | | | |
| R0DIS/ | $r_0/r_{10}/c_{10}$ when the current flows in the discharge direction: | | | |
| R10DIS/ C10DIS | GE.0.0: constant value | | | |
| | LT.0.0: absolute value is a define function or table ID. See Remark 3 for the accepted define function arguments. For a define table, the circuit parameters can be made function of the SOC and temperature. | | | |

LS-DYNA R12 6-109 (EM)

| VARIABLE | DESCRIPTION |
|-------------------|---|
| R20CHA/ | $r_{20}/r_{30}/c_{20}/c_{30}$ when the current flows in the charge direction: |
| R30CHA/ | GE.0.0: constant value |
| C20CHA/ C30CHA | LT.0.0: absolute value is a define function or table ID. See Remark 4 for the accepted define function arguments. For a define table, the circuit parameters can be made function of the SOC and temperature. |
| R20DIS/ | $r_{20}/r_{30}/c_{20}/c_{30}$ when the current flows in the discharge direction: |
| R30DIS/ | GE.0.0: constant value. |
| C20DIS/ C30DIS | LT.0.0: absolute value is a define function or table ID. See Remark 4 for the accepted define function arguments. For a define table, the circuit parameters can be made function of the SOC and temperature. |
| TEMP | Constant temperature value used for the Randles circuit parameters in case there is no coupling with the thermal solver. |
| DUDT | If negative integer, load curve ID of the reversible heat as a function of SOC. |
| TEMPU | Temperature Unit : |
| | EQ.0: The temperature is in Celsius |
| | EQ.1: The Temperature is in Kelvin |
| USESOCS | Use SOC shift (See Remark 1): |
| | EQ.0: Don't use the added SOCshift |
| | EQ.1: Use the added SOCshift |
| TAU | Damping time in the SOCshift equation (See Remark 1) |
| FLCID | Load curve giving $f(i)$ where I is the total current in the unit cell |

Remarks:

1. **Accounting for Diffusion Limitations.** Sometimes, an extra term called SOCshift (or SocS) can be added at high rate discharges to account for diffusion limitations. The SOCshift is added to SOC for the calculation of the OCV u(SOC + SOCshift) and $r_0(SOC + SOCshift)$. SOCshift satisfies the following equation:

3.110 (EM) LS-DYNA Version 980

$$\frac{d(SOCshift)}{dt} + \frac{SOCshift}{\tau} = \frac{f(i(t))}{\tau}$$

with SOCshift(t = 0) = 0.

- 2. **User defined ECMs.** Randles circuits are based on the finite element Robin boundary condition, acting similarly to a convection boundary condition for the heat equation. As such, the circuit equation is decomposed into a term that will enter the left-hand-side of the stiffness matrix and a term that will be added to the right-hand-side. Changing the definition of those terms allows the user to replace the Randles circuits by any type of Equivalent Circuit model (ECM). This is the purpose of RDLTYPE=-1 where the term entering the l.h.s is defined by a negative integer referring to a *DEFINE_FUNCTION ID in ROCHA (unit consistency: Resistance) while a negative integer in RODIS, associated to a *DEFINE_FUNCTION will give the term entering in the r.h.s (unit consistency: current).
- 3. **DEFINE FUNCTION.** Variables available for *DEFINE_FUNTION in EM_-RANDLES keywords:

| *DEFINE_ FUNCTIONs: Variable names : | Randles Circuit parameters $(r_0, r_{10}, c_{10} \ etc)$ | RDLTYPE = -1 | Internal Short | Exothermic reaction |

|----------|-------------|
| VARIABLE | DESCRIPTION |

RDLID ID of the Randles Cell

LS-DYNA R12 6-115 (EM)

| VARIABLE | DESCRIPTION |
|----------|--|
| RDLTYPE | Type of Randles Cell: |
| | EQ1: User defined equivalent circuit model. See Remark 3. |
| | EQ.0: 0-order Randles Cell |
| | EQ.1: 1-order Randles Cell |
| | EQ.2: 2-order Randles Cell |
| | EQ.3: 3-order Randles Cell |
| PSID | Part Set ID of all the parts composing the cell |
| RDLAREA | Randles Area: |
| | EQ.1: the parameters are per unit area and will be scaled in each Randle circuit by a factor depending on the local area of the circuit. Unit consistency in S.I: Ohms times square meters. |
| | EQ.2: the parameters are defined for the whole cell and will be scaled in each Randle circuit by a factor depending on the local area of the circuit and the global area of the cell (default). Unit consistency in S.I: Ohms. |
| | EQ.3: the parameters are not scaled by area factors. Unit consistency in S.I: Ohms. |
| Q | Cell capacity |
| CQ | SOC conversion factor ($\%$ /s), known to be equal to 1/36 in SI units |
| SOCINIT | Initial state of charge of the cell |
| SOCTOU | Equilibrium voltage (OCV): |
| | GE.0.0: constant value |
| | LT.0.0: SOCTOU is a load curve ID defining equilibrium voltage (OCV) as a function of the state of charge (SOC). |

3.116 (EM) LS-DYNA Version 980

| VARIABLE | DESCRIPTION |
|-------------------|---|
| R0CHA/ | $r_0/r_{10}/c_{10}$ when the current flows in the charge direction: |
| R10CHA/ C10CHA | GE.0.0: constant value |
| Clocili | LT.0.0: absolute value is a define function or table ID. See Remark 4 for the accepted define function arguments. For a define table, the circuit parameters can be made function of the SOC and temperature. |
| R0DIS/ | $r_0/r_{10}/c_{10}$ when the current flows in the discharge direction: |
| R10DIS/ C10DIS | GE.0.0: constant value |
| Clobis | LT.0.0: absolute value is a define function or table ID. See Remark 4 for the accepted define function arguments. For a define table, the circuit parameters can be made function of the SOC and temperature. |
| R20CHA/ | $r_{20}/r_{30}/c_{20}/c_{30}$ when the current flows in the charge direction: |
| R30CHA/ | GE.0.0: constant value |
| C20CHA/ C30CHA | LT.0.0: absolute value is a define function or table ID. See Remark 4 for the accepted define function arguments. For a define table, the circuit parameters can be made function of the SOC and temperature. |
| R20DIS/ | $r_{20}/r_{30}/c_{20}/c_{30}$ when the current flows in the discharge direction: |
| R30DIS/ | GE.0.0: constant value |
| C20DIS/ C30DIS | LT.0.0: absolute value is a define function or table ID. See Remark 4 for the accepted define function arguments. For a define table, the circuit parameters can be made function of the SOC and temperature. |
| TEMP | Constant temperature value used for the Randles circuit parameters in case there is no coupling with the thermal solver (FRTHER $= 0$) |
| FRTHER | From thermal: |
| | EQ.0: the temperature used in the Randles circuit parameters is TEMP |
| | EQ.1: the temperature used in the Randles circuit parameter is the temperature from the thermal solver. |
| R0TOTH | r_0 to thermal: |

LS-DYNA R12 6-117 (EM)

| VARIABLE | DESCRIPTION |
|----------|---|
| | EQ.0: the joule heating in the resistance r_0 is not added to the thermal solver. |
| | EQ.1: the joule heating in the resistance r_0 is added to the thermal solver. |
| DUDT | If negative integer, load curve ID of the reversible heat as a function of SOC. |
| TEMPU | Temperature unit: |
| | EQ.0: the temperature is in Celsius. |
| | EQ.1: the temperature is in Kelvin. |
| USESOCS | Use SOCshift (see Remark 2): |
| | EQ.0: don't use the added SOCshift. |
| | EQ.1: use the added SOCshift. |
| TAU | Damping time in the SOCshift equation (see Remark 2) |
| FLCID | Load curve giving $f(i)$ where i is the total current in the unit cell |

Remarks:

- 1. **Sectioning of Circuit.** Each part of PSID is defined by *PART_COMPOSITE_TSHELL. With this keyword for defining the part, each layer of a part can serve a different function, namely, as a current collector positive, current collector negative, separator, negative electrode, or positive electrode. A given layer's function is defined in the RDLTYPE field of *EM_MAT_001.
- 2. **Accounting for Diffusion Limitations.** Sometimes, an extra term called SOCshift (or SocS) can be added at high rate discharges to account for diffusion limitations. The SOCshift is added to SOC for the calculation of the OCV u(SOC + SOCshift) and $r_0(SOC + SOCshift)$. SOCshift satisfies the following equation:

$$\frac{d(SOCshift)}{dt} + \frac{SOCshift}{\tau} = \frac{f(i(t))}{\tau}$$

with SOCshift(t = 0) = 0.

- 3. **User defined ECMs**. Randles circuits are based on the finite element Robin boundary condition, acting similarly to a convection boundary condition for the heat equation. As such, the circuit equation is decomposed into a term that will enter the left-hand-side of the stiffness matrix and a term that will be added to the right-hand-side. Changing the definition of those terms allows the user to replace the Randles circuits by any type of Equivalent Circuit model (ECM). This is the purpose of RDLTYPE = -1 where the term entering the l.h.s is defined by a negative integer referring to a *DEFINE_FUNCTION ID in ROCHA (unit consistency: Resistance) while a negative integer in R0DIS, associated to a *DEFINE_FUNCTION will give the term entering in the r.h.s (unit consistency: current).
- 4. **DEFINE FUNCTION** variables available in EM_RANDLES keywords :

| *DEFINE_ FUNCTIONs: Variable names : | Randles Circuit parameters $(r_0, r_{10}, c_{10} \ etc)$ | RDLTYPE = -1 | Internal Short | Exothermic reaction |

LS-DYNA R12 6-121 (EM)

*EM_RANDLES_SHORT

Purpose: For battery cell internal short, define conditions to turn on a Randles short (replace one or several Randles circuits by resistances), and to define the value of the short resistance.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|----------|---------|---|---|---|---|---|---|
| Variable | AREATYPE | FUNCTID | | | | | | |
| Туре | I | I | | | | | | |
| Default | none | None | | | | | | |

VARIABLE

DESCRIPTION

AREATYPE

Works the same way as RDLAREA in *EM_RANDLES_SOLID or in *EM_RANDLES_TSHELL:

- EQ.1: The resistance inverse in FUNCTID is per unit area so that, for each local Randles circuit, the result returned by FUNCTID is multiplied by a factor 1./areaLoc (areaLoc is the local area associated to each Randles circuit while areaGlob is the area of the whole cell). Unit consistency in S.I: Ohms times square meters.
- EQ.2: Default. The resistance in FUNCTID is for the whole cell (the whole cell is shorted), so that, for each Randles circuit, the result returned by FUNCTID is multiplied by a factor areaGlob/areaLoc. Unit consistency in S.I: Ohms.
- EQ.3: The resistance returned by FUNCTID is taken as is for each Randles circuit. Unit consistency in S.I: Ohms.

FUNCTID

DEFINE_FUNCTION ID giving the local resistance function of local parameters for the local Randles circuit. See Remark 2.

Remarks:

1. If the return value of the function is zero, there is no short, the Randles circuit is maintained. A positive returned value will replace the Randles circuit by the returned short resistance. In order to ensure that the short is maintained even after the original criteria is no longer met, the default positive value may be

3.122 (EM)

replaced by a negative value. The solver will then take the absolute value returned and adopt it as the new short resistance in case the original short criteria is no longer met rather than reverting to a Randles circuit.

2. The parameter description is:

| | description is: | I | | |

3. An example of a function :

*DEFINE_FUNCTION

FID (Function Id)

3.124 (EM) LS-DYNA Version 980

```
Float resistance_short_randle(
float time,
float x_ccp,float y_ccp,float z_ccp,
float x_sep,float y_sep,float z_sep,
float x_sem,float y_sem,float z_sem,
float x_ccm,float y_ccm,float z_ccm)
{ float seThick0;
seThick0 = 1.e-5;
seThick=(sqrt(x_sep-x_sem)^2+(y_sep-y_sem)^2+(z_sep-z_sem)^2);
if (seThick >= seThick0) then
return -1.e-3;
else
return 1.e-2;
endif
```

In this example, as long as seThick is smaller than seThick0, no short occurs. Once seThick becomes larger than seThick0, a short occurs and the short resistance is 1.e-2. If during the run, seThick once again becomes smaller than seThick0, the short is maintained and the short resistance becomes 1.e-3. Replacing 1.e-3 by 0. would cause the short to revert to the original Randles circuit.

LS-DYNA R12 6-125 (EM)

VARIABLE DESCRIPTION

RDLID ID of the Randles Cell

RDLTYPE Type of Randles Cell:

EQ.-1: User defined equivalent circuit model. See Remark 3.

EQ.0: 0-order Randles CellEQ.1: 1-order Randles Cell

LS-DYNA R12 6-127 (EM)

| VARIABLE | DESCRIPTION |
|----------|--|
| | EQ.2: 2-order Randles Cell |
| | EQ.3: 3-order Randles Cell |
| RDLAREA | Randles Area: |
| | EQ.1: the parameters are per unit area and will be scaled in each Randle circuit by a factor depending on the local area of the circuit. Unit consistency in S.I: Ohms times square meters. |
| | EQ.2: the parameters are defined for the whole cell and will be scaled in each Randle circuit by a factor depending on the local area of the circuit and the global area of the cell (default). Unit consistency in S.I: Ohms. |
| | EQ.3: the parameters are not scaled by area factors. Unit consistency in S.I: Ohms. |
| CCPPART | Current Collector Positive Part ID |
| CCNPART | Current Collector Negative Part ID |
| SEPPART | Separator Part ID |
| PELPART | Positive Electrode Part ID |
| NELPART | Negative Electrode Part ID |
| Q | Cell capacity. |
| CQ | SOC conversion factor ($\%$ /s), known to be equal to 1/36 in S.I units. |
| SOCINIT | Initial state of charge of the cell. |
| SOCTOU | Equilibrium voltage (OCV): |
| | GE.0.0: constant value |
| | LT.0.0: SOCTOU is a load curve ID defining equilibrium voltage (OCV) as a function of the state of charge (SOC). |

3.128 (EM) LS-DYNA Version 980

| VARIABLE | DESCRIPTION |
|-------------------|---|
| R0CHA/ | $r_0/r_{10}/c_{10}$ when the current flows in the charge direction: |
| R10CHA/ C10CHA | GE.0.0: constant value |
| CIOCITA | LT.0.0: absolute value is a define function or table ID. See Remark 4 for the accepted define function arguments. For a define table, the circuit parameters can be made function of the SOC and temperature. |
| RODIS/ | $r_0/r_{10}/c_{10}$ when the current flows in the discharge direction: |
| R10DIS/ C10DIS | GE.0.0: constant value |
| Clobio | LT.0.0: absolute value is a define function or table ID. See Remark 4 for the accepted define function arguments. For a define table, the circuit parameters can be made function of the SOC and temperature. |
| R20CHA/ | $r_{20}/r_{30}/c_{20}/c_{30}$ when the current flows in the charge direction: |
| R30CHA/ | GE.0.0: constant value |
| C20CHA/ C30CHA | LT.0.0: absolute value is a define function or table ID. See Remark 4 for the accepted define function arguments. For a define table, the circuit parameters can be made function of the SOC and temperature. |
| R20DIS/ | $r_{20}/r_{30}/c_{20}/c_{30}$ when the current flows in the discharge direction: |
| R30DIS/ | GE.0.0: constant value |
| C20DIS/ C30DIS | LT.0.0: absolute value is a define function or table ID. See Remark 4 for the accepted define function arguments. For a define table, the parameters can be made function of the SOC and temperature. |
| ТЕМР | Constant temperature value used for the Randles circuit parameters in case there is no coupling with the thermal solver (FRTHER $= 0$) |
| FRTHER | From Thermal: |
| | EQ.0: The temperature used in the Randles circuit parameters is TEMP. |
| | EQ.1: The temperature used in the Randle circuit parameter is the temperature from the thermal solver. |

LS-DYNA R12 6-129 (EM)

| VARIABLE | DESCRIPTION |
|----------|--|
| R0TOTH | r_0 to Thermal: |
| | EQ.0: The joule heating in the resistance r0 is not added to the thermal solver. |
| | EQ.1: The joule heating in the resistance r0 is added to the thermal solver. |
| DUDT | If negative integer, load curve ID of the reversible heat as a function of SOC. |
| TEMPU | Temperature Unit : |
| | EQ.0: The temperature is in Celsius |
| | EQ.1: The Temperature is in Kelvin |
| USESOCS | Use SOC shift (See Remark 2): |
| | EQ.0: Don't use the added SOCshift |
| | EQ.1: Use the added SOCshift |
| TAU | Damping time in the SOCshift equation (See Remark 1) |
| FLCID | Load curve giving $f(i)$ where I is the total current in the unit cell |

Remarks:

- Element Normal orientation. the solid element normals must all be oriented in the positive current collector to negative current collector direction in order to detect which current collector nodes are connected to one another. Furthermore, any number of layers can be modelled but the meshes of the CCP, anode, separator, cathode, CCN must be continuous and have merged nodes at the boundaries.
- 2. **Accounting for Diffusion Limitations.** Sometimes, an extra term called SOCshift (or SocS) can be added at high rate discharges to account for diffusion limitations. The SOCshift is added to SOC for the calculation of the OCV u(SOC + SOCshift) and $r_0(SOC + SOCshift)$. SOCshift satisfies the following equation:

$$\frac{d(SOCshift)}{dt} + \frac{SOCshift}{\tau} = \frac{f(i(t))}{\tau}$$

with SOCshift(t = 0) = 0.

- 3. **User defined ECMs.** Randles circuits are based on the finite element Robin boundary condition, acting similarly to a convection boundary condition for the heat equation. As such, the circuit equation is decomposed into a term that will enter the left-hand-side of the stiffness matrix and a term that will be added to the right-hand-side. Changing the definition of those terms allows the user to replace the Randles circuits by any type of Equivalent Circuit model (ECM). This is the purpose of RDLTYPE=-1 where the term entering the l.h.s is defined by a negative integer referring to a *DEFINE_FUNCTION ID in ROCHA (unit consistency: Resistance) while a negative integer in RODIS, associated to a *DEFINE_FUNCTION will give the term entering in the r.h.s (unit consistency: current).
- 4. **DEFINE FUNCTION.** Variables available in EM_RANDLES keywords for *DE-FINE_FUNCTION:

| *DEFINE_ FUNCTIONs: Variable names : | Randles Circuit parameters $(r_0, r_{10}, c_{10} \ etc)$ | RDLTYPE = -1 | Internal Short | Exothermic reaction |

LS-DYNA R12 6-133 (EM)

*EM_ROTATION_AXIS

Purpose: Define a rotation axis for the EM solver. This is used with the 2D axisymmetric solver. The axis is defined by a point and a direction.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|------|------|------|------|--------|---|
| Variable | ХР | YP | ZP | XD | YD | ZD | NUMSEC | |
| Туре | F | F | F | F | F | F | I | |
| Default | none | |

| VARIABLE | DESCRIPTION |
|------------|---|
| XP, YP, ZP | x, y , and z coordinates of the point |
| XD, YD, ZD | x, y , and z components of direction of the axis |
| NUMSEC | Number of Sectors. This field gives the ratio of the full circle to the angular extension of the mesh. This has to be a power of two. For example, NUMSEC = 4 means that the mesh of the part represents one fourth of the total circle. If NUMSEC = 0 for *EM_2DAXI, the solver will replace it with this value. |

3.134 (EM) LS-DYNA Version 980

*EM

${\bf *EM_SOLVER_BEM}$

Purpose: Define the type of linear solver and pre-conditioner as well as tolerance for the EM_BEM solve.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------------------|--------|-------|--------|---------|---------|---|---|
| Variable | RELTOL | MAXITE | STYPE | PRECON | USELAST | NCYLBEM | | |
| Туре | I | I | 1 | I | I | I | | |
| Default | 10 ⁻⁶ | 1000 | 2 | 2 | 1 | 5000 | | |

| VARIABLE | DESCRIPTION |
|----------|---|
| RELTOL | Relative tolerance for the iterative solvers (PCG or GMRES). If the results are not accurate enough, the user should try to decrease this tolerance. More iterations will then be needed. |
| MAXITER | Maximum number of iterations |
| STYPE | Solver type: |
| | EQ.1: direct solve – the matrices will then be considered as dense. |
| | EQ.2: pre-conditioned gradient method (PCG) - this method allows for block matrices with low rank blocks, and thus reduces memory used. |
| | EQ.3: GMRES method - this method allows for block matrices with low rank blocks and thus reduces memory used. The GMRES option only works in serial for now. |
| PRECON | Preconditioner type for PCG or GMRES iterative solves: |
| | EQ.0: no preconditioner |
| | EQ.1: diagonal line |
| | EQ.2: diagonal block |
| | EQ.3: broad diagonal including all neighbor faces |
| | EQ.4: LLT factorization. |

LS-DYNA R12 6-135 (EM)

| VARIABLE | DESCRIPTION |
|----------|--|
| USELAST | This is used only for iterative solvers (PCG or GMRES). |
| | EQ1: Start from 0 as initial guess for solution of the linear system. |
| | EQ.1: Starts from the previous solution normalized by the RHS change. |
| NCYLBEM | Number of electromagnetism cycles between the recalculation of BEM matrices. If a negative value is entered, then the absolute value will refer to a load curve giving NCYCLBEM as a function of time. |

Remarks:

- 1. **USELAST.** Using USELAST = 1 can save many iterations in the subsequent solves if the vector solution of the present solve is assumed to be nearly parallel to the vector solution of the previous solve, as usually happens in time-domain eddy-current problems.
- 2. **Moving Conductors.** Since the BEM matrices depend on (and only on) the surface node coordinates of the conductors, it is important to recalculate them when the conductors are moving. The frequency with which they are updated is controlled by NCYLBEM. Note that very small values, for example NCYLBEM = 1, should, generally, be avoided since this calculation involves a high computational cost. However, when two conductors are moving and in contact with each other it is recommended to recalculate the matrices at *every* time step.

3.136 (EM) LS-DYNA Version 980

*EM_SOLVER_BEMMAT

Purpose: Define the type of BEM matrices as well as the way they are assembled.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|---|---|---|---|---|---|--------|
| Variable | MATID | | | | | | | RELTOL |
| Туре | I | | | | | | | F |
| Default | none | | | | | | | 1E-6 |

| VARIABLE | DESCRIPTION |
|----------|---|
| MATID | Defines which BEM matrix the card refers to: |
| | EQ.1: P matrix |
| | EQ.2: Q matrix |
| RELTOL | Relative tolerance on the sub-blocks of the matrix when doing low rank approximations. The user should try to decrease these tolerances if the results are not accurate enough. More memory will then be needed. |

LS-DYNA R12 6-137 (EM)

*EM_SOLVER_FEM

Purpose: Define some parameters for the EM FEM solver.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------------------|--------|-------|--------|---------|----------|---|---|
| Variable | RELTOL | MAXITE | STYPE | PRECON | USELAST | NCYCLFEM | | |
| Туре | I | I | I | I | I | I | | |
| Default | 10 ⁻³ | 1000 | 1 | 1 | 1 | 5000 | | |

| VARIABLE | DESCRIPTION |
|----------|---|
| RELTOL | Relative tolerance for the iterative solvers (PCG or GMRES). If the results are not accurate enough, you should try to decrease this tolerance. More iterations will then be needed. |
| MAXITER | Maximum number of iterations |
| STYPE | Solver type: |
| | EQ.1: direct solve |
| | EQ.2: Conditioned Gradient Method (PCG) |
| PRECON | Preconditioner type for PCG. |
| | EQ.0: no preconditioner |
| | EQ.1: diagonal line |
| USELAST | This is used only for iterative solvers (PCG). |
| | EQ1 : starts from 0 as initial solution of the linear system. |
| | EQ.1: starts from previous solution normalized by the right-hand-side change. |
| NCYCLFEM | Number of electromagnetism cycles between the recalculation of FEM matrices. If a negative value is entered, then the absolute value will refer to a load curve giving NCYCLFEM function of time. |

3.138 (EM) LS-DYNA Version 980

*EM

Remarks:

1. **Starting from Previous Solution.** Using USELAST = 1 can save many iterations in the subsequent solves if the vector solution of the present solve is assumed to be nearly parallel to the vector solution of the previous solve, as usually happens in time-domain eddy-current problems.

- 2. **Default Values.** The default values are only valid when the PCG resolution method (STYPE = 2) is used. For the default direct solve (STYPE = 1), those values are ignored.
- 3. **NCYCLFEM.** When the conductor parts are deforming or undergoing changes in their EM material properties (conductivity for example), the FEM matrices should be recalculated more often, so NCYCLFEM may need to be changed.

LS-DYNA R12 6-139 (EM)

*EM_SOLVER_FEMBEM

Purpose: Define some parameters for the coupling between the EM_FEM and EM_BEM solvers.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|--------|--------|--------|---|-------|---|---|---|
| Variable | RELTOL | MAXITE | FORCON | | STYPE | | | |
| Туре | F | I | I | | 1 | | | |
| Default | 10-2 | 50 | 0 | | 0 | | | |

| VARIABLE | DESCRIPTION |
|----------|---|
| RELTOL | Relative tolerance for the FEM/BEM solve. The user should try to decrease this tolerance if the results are not accurate enough. However, more iterations will then be needed. |
| MAXITER | Maximal number of iterations |
| FORCON | Force convergence: EQ.0: The code stops with an error if no convergence. EQ.1: The code continues to the next time step even if the REL- TOL convergence criteria has not been reached. |
| STYPE | Solve type (see Remark 1): EQ.0: Richardson method, that is, partitioned solve for the FEM/BEM systems |
| | EQ.3: Monolithic solve, that is, the FEM and BEM systems are solved in one single bloc |

Remarks:

1. **STYPE.** For the default Richardson method, at each time step, the solver will iterate between the FEM and the BEM system until reaching convergence (based on the choice of RELTOL and MAXITER). The cost for this solve is low. However, in order to ensure stability, we recommend imposing a limit on the timestep based on the characteristic diffusion time (See *EM_CONTROL_TIMESTEP). Furthermore, it can be unstable whenever magnetic materials are involved (conductor's permeability different than vacuum permeability). The

3.140 (EM) LS-DYNA Version 980

monolithic solver on the other hand aims to remove those two limitations by solving both the FEM and BEM systems in one single monolithic bloc. For such cases, it is, therefore, the recommended choice.

LS-DYNA R12 6-141 (EM)

*ICFD

The keyword *ICFD covers all the different options available in the incompressible fluid solver. The keyword cards in this section are defined in alphabetical order:

| VARIABLE | DESCRIPTION |
|----------|---|
| PID | PID of the fluid surface where a free-slip boundary condition is applied. |

7-8 (ICFD) LS-DYNA R12

*ICFD_BOUNDARY_FSI

Purpose: This keyword defines which fluid surfaces will be considered in contact with the solid surfaces for fluid-structure interaction (FSI) analysis. This keyword should not be defined if *ICFD_CONTROL_FSI is not defined.

Include as many cards as needed. This input ends at the next keyword ("*") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|---|---|---|---|---|---|---|
| Variable | PID | | | | | | | |
| Туре | I | | | | | | | |
| Default | none | | | | | | | |

| VARIABLE | DESCRIPTION |
|----------|--|
| PID | PID of the fluid surface in contact with the solid domain. |

LS-DYNA R12 7-9 (ICFD)

*ICFD_BOUNDARY_FSI_EXCLUDE

Purpose: This keyword defines which solid part IDs are excluded from the FSI search. No forces coming from the fluid will be transmitted on those parts.

Include as many cards as needed. This input ends at the next keyword ("*") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|---|---|---|---|---|---|---|
| Variable | PID | | | | | | | |
| Туре | I | | | | | | | |
| Default | none | | | | | | | |

| VARIABLE | DESCRIPTION |
|----------|---|
| PID | Part ID of the solid mechanics problem which is to be excluded from the FSI analysis. |

7-10 (ICFD) LS-DYNA R12

*ICFD_BOUNDARY_FSWAVE

Purpose: Impose a wave inflow boundary condition.

Include as many cards as needed. This input ends at the next keyword (" \ast ") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|-------|------|------|-------|------|--------|------|
| Variable | PID | WTYPE | H0 | WAMP | WLENG | WMAX | SFLCID | WANG |
| Туре | I | I | F | F | F | F | I | F |
| Default | none | none | none | none | none | none | none | none |

| VARIABLE | DESCRIPTION |
|----------|---|
| PID | PID for a fluid surface. |
| WTYPE | Wave Type: |
| | EQ.1: Stokes wave of first order |
| | EQ.2: Stokes wave of second order |
| | EQ.3: Stokes wave of fifth order |
| | EQ.4: Solitary wave |
| | EQ.5: Irregular waves using JONSWAP spectrum |
| Н0 | Water level (from the bottom of the channel) for the unperturbed condition |
| WAMP | Wave amplitude or height for WTYPE = 1 to WTYPE = 4. Significant wave height for WTYPE = 5. |
| WLENG | Wave Length for WTYPE = 1 and WTYPE = 2. Wave Period for WTYPE = 3. Not used for WTYPE = 4. Minimum wave frequency in spectrum (rad/sec) for WTYPE = 5. |
| WMAX | Maximum wave frequency in spectrum (rad/sec) for WTYPE = 5. Angle between the boundary and the incident waves (in degrees) for WTYPE = 3 . |
| SFLCID | Scale factor LCID on the wave amplitude for WTYPE = 1, WTYPE = 2 and WTYPE = 3. Number of Wave modes (default = 1024) for WTYPE = 5. |

LS-DYNA R12 7-11 (ICFD)

VARIABLE

DESCRIPTION

WANG

Angle between incoming wave direction and x-axis for z and y-aligned gravity vector, or angle between incoming wave direction and y-axis for x-aligned gravity vector.

7-12 (ICFD) LS-DYNA R12

*ICFD_BOUNDARY_GROUND

Purpose: Specify the fluid boundary with a ground boundary condition. The ground boundary condition is similar to the nonslip boundary condition except that it will keep V=0 in all circumstances, even if the surface nodes are moving. This is useful in cases where the nodes are allowed to move or translate (using ICFD_BOUNDARY_PRE-SCRIBED_MOVEMESH for example) but those displacements are only to accommodate for mesh movement and do not correspond to a physical motion.

Include as many cards as needed. This input ends at the next keyword ("*") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|---|---|---|---|---|---|---|
| Variable | PID | | | | | | | |
| Туре | I | | | | | | | |
| Default | none | | | | | | | |

| VARIABLE | DESCRIPTION |
|----------|--|
| PID | PID of the fluid surface where a ground boundary condition is applied. |

LS-DYNA R12 7-13 (ICFD)

*ICFD_BOUNDARY_NONSLIP

Purpose: Specify the fluid boundary with a non-slip boundary condition.

Include as many cards as needed. This input ends at the next keyword (" \ast ") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|---|---|---|---|---|---|---|
| Variable | PID | | | | | | | |

| VARIABLE | DESCRIPTION |
|----------|--|
| PID | PID of the fluid surface where a non-slip boundary condition is applied. |

7-14 (ICFD) LS-DYNA R12

*ICFD_BOUNDARY_PERIODIC

Purpose: Allows the user to impose various kind of constraints between two fluid surfaces.

Include as many cards as needed. This input ends at the next keyword (" \ast ") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|-------|------|--------|------|------|-------|---|
| Variable | PID | PTYPE | PID2 | PDLCID | AXE | PTID | ANGLE | |
| Туре | I | I | I | I | I | I | F | |
| Default | none | none | none | none | none | none | none | |

| VARIABLE | DESCRIPTION |
|----------|---|
| PID | PID for a fluid surface. |
| PTYPE | Boundary type: |
| | EQ.1: Periodic rotation boundary condition. |
| | EQ.2: Periodic reflective boundary condition. |
| | EQ.3: Sliding mesh boundary condition. |
| PID2 | PID for the second surface mesh. The boundary condition defined in PTYPE will applied between PID and PID2. See Remark 1. |
| PDLIC | Optional load curve ID to describe the pressure drop value versus time between PID and PID2, see *DEFINE_CURVE,*DEFINECURVE_FUNCTION or *DEFINE_FUNCTION. If a DEFINEFUNCTION is used, the following parameters are allowed: $f(x,y,z,vx,vy,vz,temp,pres,time)$. |

LS-DYNA R12 7-15 (ICFD)

| VARIABLE | DESCRIPTION | | | | | |
|----------|-----------------------------|---|--|--|--|--|
| AXE | If PTYPE = 1 | l: | | | | |
| | EQ.1: | Rotation around X-Axis. | | | | |
| | EQ.2: | Rotation around Y-Axis. | | | | |
| | EQ.3: | Rotation around Z-Axis. | | | | |
| | If PTYPE = 3 | 3: | | | | |
| | EQ.0: | The contact distance between two faces of PID and PID2 is based on the characteristic local element size. | | | | |
| | EQ.1 : | The contact distance between two faces of PID and PID2 is based on the characteristic local element size scaled by a factor given by ANGLE. | | | | |
| | EQ.2 : | The contact distance between two faces of PID and PID2 is based on the length given by AN-GLE. | | | | |
| PTID | Origin point I FINE_POINT). | D for PTYPE = 1 and PTYPE = 2 (See *ICFD_DE- | | | | |
| ANGLE | O | e for PTYPE = 1. Characterizes contact distance for axe different then 0. | | | | |

Remarks:

1. **Selection of master PID.** When the two meshes are of different densities, it is recommended to select the finer mesh as PID and the coarser as PID2.

7-16 (ICFD) LS-DYNA R12

*ICFD_BOUNDARY_PRESCRIBED_MOVEMESH

Purpose: Allows the node of a fluid surface to translate in certain directions using an ALE approach. This is useful in piston type applications or can also be used in certain cases to avoid big mesh deformation.

Include as many cards as needed. This input ends at the next keyword ("*") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|------|------|---|---|---|---|

| VARIABLE | DESCRIPTION |
|----------|---|
| PID | PID for a fluid surface. |
| LCID | Load curve ID to describe the pressure value versus time, see *DEFINE_CURVE, *DEFINE_CURVE_FUNCTION or *DEFINE_FUNCTION. If a DEFINE_FUNCTION is used, the following parameters are allowed: $f(x, y, z, vx, vy, vz, temp, pres, time)$. |
| SF | Load curve scale factor. (default = 1.0) |
| DEATH | Time at which the imposed motion/constraint is removed: EQ.0.0: default set to 10E28 |
| BIRTH | Time at which the imposed pressure is activated starting from the initial abscissa value of the curve |

7-18 (ICFD) LS-DYNA R12

*ICFD_BOUNDARY_PRESCRIBED_TEMP

Purpose: Impose a fluid temperature on the boundary.

Include as many cards as needed. This input ends at the next keyword (" \ast ") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|----|--------|-------|---|---|---|
| Variable | PID | LCID | SF | DEATH | BIRTH | | | |
| Туре | I | I | F | F | F | | | |

| VARIABLE | DESCRIPTION |
|----------|---|
| PID | PID for a fluid surface. |
| LCID | Load curve ID to describe the temperature value versus time; see *DEFINE_CURVE, *DEFINE_CURVE_FUNCTION or *DEFINEFUNCTION. If a DEFINE_FUNCTION is used, the following parameters are allowed: $f(x, y, z, vx, vy, vz, temp, pres, time)$. |
| SF | Load curve scale factor. (default = 1.0) |
| DEATH | Time at which the imposed temperature is removed: EQ.0.0: default set to 10E28 |
| BIRTH | Time at which the imposed temperature is activated starting from the initial abscissa value of the curve |

LS-DYNA R12 7-19 (ICFD)

*ICFD_BOUNDARY_PRESCRIBED_TURBULENCE

Purpose: Optional keyword that allows the user to strongly impose the turbulence quantities when a RANS turbulence model is selected. See ICFD_CONTROL_TURBU-LENCE. Mainly used to modify the default boundary conditions at the inlet.

Include as many cards as needed. This input ends at the next keyword ("*") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|-------|-----|------|---|---|---|---|
| Variable | PID | VTYPE | IMP | LCID | | | | |
| Туре | I | I | I | I | | | | |
| Default | none | none | 0 | none | | | | |

| VARIABLE | DESCRIPTION |
|----------|---|
| PID | PID for a fluid surface. |
| VTYPE | Variable type. |
| | EQ.1: kinetic turbulent energy |
| | EQ.2: turbulent dissipation rate |
| | EQ.3: specific dissipation rate |
| | EQ.4: modified turbulent viscosity |
| IMP | Imposition method. |
| | EQ.0: Direct imposition through value specified by LCID |
| | EQ.1: Using turbulent Intensity specified by LCID if VTYPE = 1. Using turbulence length scale specified by LCID if VTYPE = 2,3 and 4. |
| | EQ.2: Using turbulent viscosity ratio specified by LCID. Only available for VTYPE = 2 and VTYPE = 3. |
| LCID | Load curve ID to describe the variable value versus time, see *DE-FINE_CURVE, *DEFINE_CURVE_FUNCTION or *DEFINEFUNCTION If a DEFINE_FUNCTION is used, the following parameters are allowed: |

7-20 (ICFD) LS-DYNA R12

f(x, y, z, vx, vy, vz, temp, pres, time, k, e, mut).

Remarks:

1. At the inlet, the relationship between the turbulent kinetic energy k and the turbulence intensity I is given by :

$$k = \frac{3}{2} (U_{avg}^2 I^2)$$

By default, the solver uses an inlet intensity of 0.05 (5%).

2. At the inlet, if specifying the turbulent dissipation rate using a length scale, *l*, the following relationship will be used :

$$\epsilon = C_{\mu}^{3/4} \frac{k^{3/2}}{l}$$

By default, the solver estimates a length scale based on the total height of the channel. Otherwise, if using the turbulent viscosity ratio $r = \frac{\mu_t}{\mu}$ method:

$$\epsilon = \rho C_{\mu} \frac{k^2}{\mu \, r}$$

3. At the inlet, if specifying the specific dissipation rate using a length scale, *l*, the following relationship will be used :

$$\omega = C_{\mu}^{-1/4} \frac{k^{1/2}}{l}$$

By default, the solver estimates a length scale based on the total height of the channel. Otherwise, if using the turbulent viscosity ratio $r = \frac{\mu_t}{\mu}$ method:

$$\omega = \rho \frac{k}{\mu \, r}$$

LS-DYNA R12 7-21 (ICFD)

4. At the inlet, the relationship between the modified turbulent viscosity \tilde{v} is given and the length scale, l is given by :

$$\tilde{\nu} = 0.05 \sqrt{\frac{3}{2}} (U_{avg} \, l)$$

*ICFD_BOUNDARY_PRESCRIBED_VEL

Purpose: Impose the fluid velocity on the boundary.

Include as many cards as needed. This input ends at the next keyword (" \ast ") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|-----|------|----|-----|--------|-------|

| PID | PID for a fluid surface |
| WTYPE | Circuit type (See Remarks) : |
| | EQ.1: Windkessel circuit |
| | EQ.2: Windkessel circuit with inverted flux |
| | EQ.3: CV type circuit |
| | EQ.4: CV type circuit with inverted flux |
| R1/C1/L1/R 2/C2 | Parameters (Resistances, inductances, capacities) for the different circuits. |
| P2LCID | Load curve ID describing behavior of P2(t) function of time for CV type circuit. |

7-25 (ICFD) **LS-DYNA R12**

Figure [1]. Windkessel circuit

Remarks:

1. Figure 1 shows a Windkessel circuit and Figure 2 a CV circuit.

Figure [2]. CV Circuit

7-26 (ICFD) LS-DYNA R12

*ICFD_CONTROL_ADAPT

Purpose: This keyword will activate the adaptive mesh refinement feature. The solver will use an a-posteriori error estimator to compute a new mesh size bounded by the user to satisfy a maximum perceptual global error.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|-----|-----|-----|-----|---|-----|
| Variable | MINH | MAXH | ERR | MTH | NIT | VAR | | KIS |
| Туре | F | F | F | I | I | I | | I |
| Default | none | none | 1.0 | 0 | 0 | 0 | | 0 |

| VARIABLE | DESCRIPTION |
|----------|---|
| MINH | Minimum mesh size allowed to the mesh generator. The resulting mesh will not have an element smaller than MINH even if the minimum size does not satisfy the maximum error. |
| MAXH | Maximum mesh size |
| ERR | Maximum perceptual error allowed in the whole domain |
| MTH | Specify if the mesh size is computed based on function error or gradient error: |
| | EQ.0: function error |
| | EQ.1: gradient error |
| NIT | Number of iterations before a remeshing is forced: |
| | GT.0: Number of iterations before a forced remeshing. |
| | EQ.0: Do not remesh. |
| | LT.0: NIT is a load curve ID giving the number iterations before a remeshing as a function of time. |
| VAR | Specify which variable is taken into account for the error calculation: |
| | EQ.0: Velocity, pressure and levelset function are taken into account. |
| | EQ.1: Remove the levelset function from the error calculation. |

LS-DYNA R12 7-27 (ICFD)

VARIABLE

DESCRIPTION

- EQ.2: Remove the pressure from the error calculation.
- EQ.3: Remove both pressure and levelset function. Only the fluid velocity will therefore remain.

KIS Keep initial mesh size:

- EQ.0: Turned Off. The remeshing process will ignore the initial mesh size in the volume.
- EQ.1: Turned on. Whenever a remeshing occurs, the new local mesh size will not be allowed to be substantially coarser than the one from the previous mesh. The object is to diminish the excessive coarsening that can occur between two remeshes.

7-28 (ICFD) LS-DYNA R12

*ICFD_CONTROL_ADAPT_SIZE

Purpose: This keyword controls the re-meshing of elements taking into account the element quality and distortion in contrast to the default algorithm which only checks for inverted elements.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|------|-----|---|---|---|---|---|
| Variable | ASIZE | NIT | KIS | | | | | |
| Туре | I | I | I | | | | | |
| Default | 0 | none | 0 | | | | | |

| VAF | RIAB | LE |
|-----|------|----|
|-----|------|----|

DESCRIPTION

ASIZE

EQ.0: only re-mesh in cases where elements invert.

EQ.1: re-mesh if elements invert or if element quality deteriorates.

NIT

Number of iterations before a re-meshing is forced. If a negative integer is entered, then a load curve function of time will be used to define NIT.

KIS

Keep initial mesh size:

EQ.0: Turned Off: The remeshing process will ignore the initial mesh size in the volume.

EQ.1: Turned on: Whenever a remeshing occurs, the new local mesh size will not be allowed to be substantially coarser than the one from the previous mesh. The object is to diminish the excessive coarsening that can occur between two remeshes.

LS-DYNA R12 7-29 (ICFD)

*ICFD_CONTROL_CONJ

Purpose: This keyword allows to pick between the different coupling methods for conjugate heat transfer applications

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|---|---|---|---|---|---|------|
| Variable | CTYPE | | | | | | | TSF |
| Туре | I | | | | | | | F |
| Default | 0 | | | | | | | none |

VARIABLE

DESCRIPTION

CTYPE

Indicates the thermal coupling type.

- EQ.0: Robust and accurate monolithic coupling where the temperature field are solved simultaneously between the fluid and the structure.
- EQ.1: Weak thermal coupling. The fluid passes the heat flux to the solid at the fluid-structure interface and the solid returns the temperature which is applied as a Dirichlet condition.

TSF

Thermal Speedup Factor. This factor multiplies all thermal parameters present in the heat equation with units of time in the denominator (e.g., thermal conductivity, convection heat transfer coefficients). It is used to artificially time scale the thermal problem. A negative value will refer to a time dependent load curve.

Remarks:

1.The keyword ICFD_BOUNDARY_CONJ_HEAT is ignored if CTYPE = 1 but the keyword ICFD_BOUNDARY_FSI is needed in all thermal coupling cases.

7-30 (ICFD) LS-DYNA R12

*ICFD_CONTROL_DEM_COUPLING

Purpose: This keyword is needed to activate coupling between the ICFD and DEM solvers.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|----|------------------|----|--------|-------|---|---|
| Variable | CTYPE | ВТ | DT | SF | MAXVEL | DTYPE | | |
| Туре | 1 | F | F | F | F | I | | |
| Default | 0 | 0. | 10 ²⁸ | 1. | none | 0 | | |

| VARIABLE | DESCRIPTION |
|----------|---|
| CTYPE | Indicates the coupling direction to the solver: |
| | EQ.0: Two-way coupling between the fluid and the solid particles. |
| | EQ.1: One-way coupling. The DEM particles transfer their location to the fluid solver. |
| | EQ.2: One-way coupling. The fluid solver transfers forces to the DEM particles. |
| BT | Birth time for the DEM coupling |
| DT | Death time for the DEM coupling |
| SF | Scale factor applied to the force transmitted by the fluid to the structure |
| MAXVEL | Maximal fluid velocity that can be used for the calculation of the fluid force passed on to the DEM particle. This is to avoid having spurious velocities in the fluid causing very high and unrealistic forces on the DEM particles which may lead to a crash. |
| DTYPE | Drag calculation type: |
| | EQ.0: Constant C_d value 0.5 scaled by SF |
| | EQ.1: Morrison formula for C_d calculation based on local Reynolds number value scaled by SF. See Remark 1. |

LS-DYNA R12 7-31 (ICFD)

Remarks:

1. **Morrison's formula.** Morrison's formula for C_d calculation:

$$C_d = \frac{24}{\text{Re}} + \frac{2.6\left(\frac{\text{Re}}{5}\right)}{1 + \left(\frac{\text{Re}}{5}\right)^{1.52}} + \frac{0.411\left(\frac{\text{Re}}{2.63 \times 10^5}\right)^{-7.94}}{1 + \left(\frac{\text{Re}}{2.63 \times 10^5}\right)^{-8.00}} + \frac{0.25\left(\frac{\text{Re}}{10^6}\right)}{1 + \left(\frac{\text{Re}}{10^6}\right)}$$

*ICFD_CONTROL_EMBEDSHELL

Purpose: This keyword allows the user to control specific options related to the use of the keyword MESH_EMBEDSHELL.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|------|---|---|---|---|---|---|
| Variable | GTYPE | DIST | | | | | | |
| Туре | I | F | | | | | | |
| Default | 0 | 0.1 | | | | | | |

| VARIABLE | DESCRIPTION |
|----------|---|
| GTYPE | Gap type. Defines the criteria for selecting a distance to build the gap between the embedded nodes and the newly generated : |
| | EQ.0: Automatic and based on the surface mesh size multiplied by a scale factor given by DIST. Default method. |
| | EQ.1: Specific gap size given by the user and defined by DIST. |
| DIST | Distance value if GTYPE = 1 or scale factor value if GTYPE = 0. |

LS-DYNA R12 7-33 (ICFD)

*ICFD_CONTROL_FSI

Purpose: This keyword modifies default values for the fluid-structure interaction coupling algorithm.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|----|------------------|------|--------|-------|---|---|
| Variable | OWC | ВТ | DT | IDC | LDICSF | XPR0J | | |

| Default | 0 | 0 | 10 ²⁸ | 0.25 | 0 | 0 | | |
| | | | | | | | | |
| Card 2 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| Variable | NSUB | | | | | | | |
| Туре | I | | | | | | | |
| Default | none | | | | | | | |

VARIABLE

DESCRIPTION

OWC

Indicates the coupling direction to the solver.

- EQ.0: Two-way coupling. Loads and displacements are transferred across the FSI interface and the full non-linear problem is solved.
- EQ.1: One-way coupling. The solid mechanics solver transfers displacements to the fluid solver.
- EQ.2: One-way coupling. The fluid solver transfers stresses to the solid mechanics solver.

BT

Birth time for the FSI coupling. Before BT the fluid solver will not pass any loads to the structure, but it will receive displacements from the solid mechanics solver.

DT

Death time for the FSI coupling. After DT the fluid solver will not transfer any loads to the solid mechanics solver, but the fluid will continue to deform with the solid.

7-34 (ICFD) LS-DYNA R12

Figure 0-1. Geometry of FSI contact.

VARIABLE DESCRIPTION IDC Interaction detection coefficient. See Remark 1. **LCIDSF** Optional load curve ID to apply a scaling factor on the forces transferred to the solid: GT.0: Load curve ID for scale factor as a function of iterations LT.0: |LCIDSF| is a load curve ID for scale factor as a function of time. **XPROJ** Projection of the nodes of the CFD domain that are at the FSI interface onto the structural mesh (see Remark 2): EQ.0: No projection EQ.1: Projection **NSUB** Optional limit on the number of FSI fluid subiterations. avoids the sometimes unneeded excessive number of FSI subiterations when the fluid and very light structures (like parachutes) develop a resonance-like mode inside the FSI subiterations (coupling iterations).

Remarks:

1. **Detecting Fluid-Solid Interaction.** One of the criteria to automatically detect the fluid and solid surfaces that will interact in FSI problems is the distance *d* between a fluid (solid) node and a solid (fluid) element, respectively:

$$d \leq IDC \times \min(h, H)$$
,

where h is the size of the fluid mesh, H is the size of the solid mechanics mesh, and IDC is a detection coefficient criteria with IDC = 0.25 by default. In the majority of cases, this default value is sufficient to ensure FSI interaction. However, it can happen in special cases that the fluid and solid geometries have curvatures that differ too much (such as pipe flows in conjugate heat

LS-DYNA R12 7-35 (ICFD)

transfer applications). In such cases, a bigger IDC value may be needed. This flag should be handled with care.

2. **Rotation and Projection of Nodes.** XPROJ = 1 is recommended for cases with rotation.

7-36 (ICFD) LS-DYNA R12

*ICFD_CONTROL_GENERAL

Purpose: This keyword allows choosing between the different types of CFD analyses.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|-------|---|---|---|---|---|---|
| Variable | ATYPE | MTYPE | | | | | | |
| Туре | I | I | | | | | | |
| Default | 0 | 0 | | | | | | |

VARIABLE

DESCRIPTION

ATYPE Analysis type:

EQ. -1: Turns off the ICFD solver after initial keyword reading.

EQ.0: Transient analysis (Default)

EQ.1: Steady state analysis

MTYPE Solving Method type:

EQ.0: Fractional Step Method

EQ.1: Monolithic solve

EQ.2: Potential flow solve

LS-DYNA R12 7-37 (ICFD)

*ICFD_CONTROL_IMPOSED_MOVE

Purpose: This keyword allows the user to impose a velocity on specific ICFD parts or on the whole volume mesh. Global translation, global rotation and local rotation components can be defined and combined. This can be used in order to save calculation time in certain applications such as sloshing where the modeling of the whole fluid box and the solving of the consequent FSI problem is not necessarily needed.

7-38 (ICFD) LS-DYNA R12

| VARIABLE | DESCRIPTION |
|----------------------------|---|
| PID | PID. This can be any part ID referenced in *ICFD_PART or *ICFD_PART_VOL. If PID = 0, then the whole volume mesh will be used. |
| LCVX, LCVY, LCVZ | LCID for the velocity/displacements in the three global directions (x, y, z) . |
| VADT | Velocity/Displacements flag for translation components EQ.0: Prescribe Velocity EQ.1: Prescribe Displacements |
| ALPHAL, BETAL, GAM- MAL | LCID for the three Euler angle rotational velocities/displacements in the local reference frame (See Remark 2). |
| ALPHAG, BETAG, GAM- MAG | LCID for the three Euler angle rotational velocities/displacements in the global reference frame (See Remark 2). |
| VADR | Velocity/Displacements flag for rotation components EQ.0: Prescribe Velocity EQ.1: Prescribe Displacements |
| PTID | Point ID for the origin of the local reference frame. If not defined, the barycenter of the volume mesh will be used. |
| X1, Y1, Z1 | Three components of the local reference X1 axis. If not defined, the global x axis will be used. |
| X2, Y2, Z2 | Three components of the local reference $X2$ axis. If not defined, the global y axis will be used. |

Remarks:

LS-DYNA R12 7-39 (ICFD)

Figure 7-1. A rotation represented by Euler angles (α, β, γ) using $\mathbf{Z}(\alpha)\mathbf{X}(\beta)\mathbf{Z}(\gamma)$ intrinsic rotations.

1. **Rotations.** Any target orientation can be reached starting from a known reference orientation using a specific sequence of intrinsic rotations whose magnitudes are the Euler angles (α, β, γ) . Equivalently, any rotation matrix R can be decomposed as a product of three elemental rotation matrices. For instance:

$$\mathbf{R} = \mathbf{X}(\alpha)\mathbf{Y}(\beta)\mathbf{Z}(\gamma)$$

However, different definition of the elemental rotation matrices (x,y,z) and their multiplication order can be adopted. The ICFD solver uses the following approach and rotation matrix:

$$\mathbf{Z}(\alpha)\mathbf{X}(\beta)\mathbf{Z}(\gamma) = \begin{bmatrix} c_{\alpha}c_{\gamma} - c_{\beta}s_{\alpha}s_{\gamma} & -c_{\beta}c_{\gamma}s_{\alpha} - c_{\alpha}s_{\gamma} & s_{\alpha}s_{\beta} \\ c_{\gamma}s_{\alpha} + c_{\alpha}c_{\beta}s_{\gamma} & c_{\alpha}c_{\beta}c_{\gamma} - s_{\alpha}s_{\gamma} & -c_{\alpha}s_{\beta} \\ s_{\beta}s_{\gamma} & c_{\gamma}s_{\beta} & c_{\beta} \end{bmatrix}$$

where $X(\alpha)$, $Y(\beta)$, and $Z(\gamma)$ are the matrices representing the elemental rotations about the axes (x,y,z), $s_{\alpha}=\sin(\alpha)$, and $c_{\beta}=\cos(\beta)$.

2. **Local Coordinate Systems.** It is possible to have the ICFD parts or ICFD_-PART_VOLs rotate around the global reference frame but also to define and use a local reference frame by defining its point of origin and two of its vectors $\mathbf{v}_1 = (X1, Y1, Z1)$ and $\mathbf{v}_2 = (X2, Y2, Z2)$. The third vector is, then, in the direction of $\mathbf{v}_1 \times \mathbf{v}_2$. See Figure 7-1.

*ICFD_CONTROL_LOAD

Purpose: This keyword resets the body load in the ICFD solver to zero, while leaving the body load unchanged for the solid mechanics solver. It is useful in problems where the gravity acceleration may be neglected for the fluid problem, but not for the solid mechanics problem.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-----|---|---|---|---|---|---|---|

|----------|---|----|----|----|----|---|--|--|--|--|--|
|----------|---|----|----|----|----|---|--|--|--|--|--|

DESCRIPTION

ABL

EQ.0: the body load provided in *LOAD_BODY is reset to zero only for the fluid analysis.

LS-DYNA R12 7-41 (ICFD)

*ICFD_CONTROL_MESH

Purpose: This keyword modifies default values for the automatic volume mesh generation.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|---|--------|---------|-------|---|---|---|
| Variable | MGSF | | MSTRAT | 2DSTRUC | NRMSH | | | |
| Туре | F | | I | I | I | | | |
| Default | 1.41 | | 0 | 0 | 0 | | | |

| VARIABLE | DESCRIPTION |
|----------|--|
| MGSF | Mesh Growth Scale Factor: Specifies the maximum mesh size that the volume mesher is allowed to use when generating the volume mesh based on the mesh surface element sizes defined in *MESH_SURFACE_ELEMENT. |
| MSTRAT | Mesh generation strategy : |
| | EQ.0: Mesh generation based on Delaunay criteria |
| | EQ.1: Mesh generation based on octree (See Remark 2) |
| 2DSTRUC | Flag to decide between a unstructured mesh generation strategy in 2D or a structured mesh strategy : |
| | EQ.0: Structured mesh |
| | EQ.1: Unstructured mesh |
| NRMSH | Flag to turn off any remeshing : |
| | EQ.0: Remeshing possible |
| | EQ.1: Remeshing impossible |

Remarks:

1. For MGSF, values between 1 and 2 are allowed. Values closer to 1 will result in a finer volume mesh (1 means the volume mesh is not allowed to be coarser than the element size from the closest surface meshes) and values closer to 2 will result in a coarser volume mesh (2 means the volume can use elements as

7-42 (ICFD) LS-DYNA R12

- much as twice as coarse as those from the closest surface mesh). MGSF has a fixed value of 1 in 2D.
- 2. If the user knows in advance that no remeshing will occur during the analysis, then setting NRMSH to 1may be useful as it will free space used to back up the mesh and consequently lower memory consumption.
- 3. The Default Mesh generation strategy (based on Delaunay criteria) yields a linear interpolation of the mesh size between two surfaces facing each other whereas the octree based generation strategy allows for elements' sizes to remain close to the element surface mesh size over a longer distance. This can be useful in configurations where two surface meshes facing each other have very distinct sizes in order to create a smoother transition.

LS-DYNA R12 7-43 (ICFD)

*ICFD_CONTROL_MESH_MOV

Purpose: With this keyword the user can choose the type of algorithm for mesh movement.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|----------|--------|---|---|---|---|---|
| Variable | MMSH | LIM_ITER | RELTOL | | | | | |
| Туре | I | I | F | | | | | |
| Default | 2 | 100 | 1.0e-3 | | | | | |

| VARIABLE | DESCRIPTION |
|----------|--|
| MMSH | Mesh motion selector: |
| | EQ1: completely shuts off any mesh movement |
| | EQ.1: mesh moves based on the distance to moving walls. |
| | EQ.2: mesh moves by solving a linear elasticity problem using the element sizes as stiffness.(default) |
| | EQ.3: mesh uses a Laplacian smoothing with stiffness on edges and from node to opposite faces. Very robust, but costly. |
| | EQ.4: full Lagrangian: The mesh moves with the velocity of the flow. |
| | EQ.11: mesh moves using an implicit ball-vertex spring method. |
| LIM_ITER | Maximum number of linear solver iterations for the ball-vertex linear system. |
| RELTOL | Relative tolerance to use as a stopping criterion for the ball-vertex method iterative linear solver (conjugate gradient solver with diagonal scaling preconditioner). |

7-44 (ICFD) LS-DYNA R12

*ICFD_CONTROL_MONOLITHIC

Purpose: This keyword allows to choose between the Fractional Step Solver and the Monolithic Solver.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-----|---|---|---|---|---|---|---|
| Variable | SID | | | | | | | |
| Туре | I | | | | | | | |

VARIABLE

DESCRIPTION

MSGL

Message level.

EQ.0: only time step information is output.

EQ.1: first level solver information.

EQ.2: full output information with details about linear algebra and convergence steps.

EQ.4: full output information is also copied to the messag file.

7-46 (ICFD) LS-DYNA R12

| VARIABLE | DESCRIPTION |
|----------|---|
| OUTL | Output the fluid results in other file formats apart from d3plot. |
| | EQ.0: only d3plot output |
| | EQ.2: output a file with mesh statistics and the fluid results in OpenDX format. A directory named dx will be created in the work directory where the output files will be written. |
| | EQ.6: output a file with mesh statistics and the fluid results in VTK format readable by Paraview. A directory named vtk will be created in the work directory where the output files will be written. |
| | EQ.7: output a file with mesh statistic and the fluid results in VTU format readable by Paraview. A directory named vtk will be created in the work directory where the output files will be written. |
| | EQ.10: output a file with mesh statistic and the fluid results in Fieldview ASCII format A directory named fv will be created in the work directory where the output files will be written. Only available in 3D. |
| | EQ.11: output a file with mesh statistic and the fluid results in Fieldview binary format. A directory named fv will be created in the work directory where the output files will be written. Only available in 3D. |
| DTOUT | Time interval to print the output when OUTL is different than 0. |
| LSPPOUT | EQ.1: outputs a file with the automatically created fluid volume mesh in a format compatible for LSPP. |
| ITOUT | Iteration interval to print the output, including the d3plot files when the steady state solver is selected (See ICFD_CONTROLGENERAL). |

LS-DYNA R12 7-47 (ICFD)

*ICFD_CONTROL_OUTPUT_SUBDOM

Purpose: Defines a specific zone that should be output in the format specified by the ICFD_CONTROL_OUTPUT card rather than the whole domain.

Shape Control. First card specifies the shape of the output sub domain.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |

LS-DYNA R12 7-51 (ICFD)

*ICFD_CONTROL_PARTITION

Purpose: This keyword changes the default option for the partition in MPP, thus it is only valid in MPP.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|---|---|---|---|---|---|---|
| Variable | PTECH | | | | | | | |
| Туре | I | | | | | | | |
| Default | 1 | | | | | | | |

| VARIABLE | DESCRIPTION |
|----------|---|
| PTECH | Indicates the type of partition: |
| | EQ.1: the library Metis is used. |
| | EQ.2: partition along the axis with higher aspect ratio |
| | EQ.3: partition along X -axis |
| | EQ.4: partition along <i>Y</i> -axis |

EQ.5: partition along *Z*-axis

7-52 (ICFD) LS-DYNA R12

*ICFD_CONTROL_POROUS

Purpose: This keyword modifies the porous media solve.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|---------|---|---|---|---|---|---|---|
| Variable | PMSTYPE | | | | | | | |
| Туре | I | | | | | | | |
| Default | 0 | | | | | | | |

VARIABLE

DESCRIPTION

PMSTYPE

Indicates the porous media solve type.

- EQ.0: Anisotropic Generalized Navier-Stokes model for porous media (See *ICFD_MODEL_POROUS) using Fractional step method.
- EQ.1: Anisotropic Darcy-Forcheimer model using a Monolithic approach for the solve. This method is better suited for very low Reynolds flows through porous media (Frequently encountered in Resin Transfer Molding (RTM) applications).

Remarks:

1. When using the Anisotropic Darcy-Forcheimer model, the convective term in the Navier Stokes formulation is neglected.

LS-DYNA R12 7-53 (ICFD)

*ICFD_CONTROL_STEADY

Purpose: This keyword allows to specify convergence options for the steady state solver.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-----|-------|-------|-------|------|------|------|-------|
| Variable | ITS | T0L1 | T0L2 | T0L3 | REL1 | REL2 | UREL | ORDER |
| Туре | I | F | F | F | F | F | F | I |
| Default | 1e6 | 1.e-3 | 1.e-3 | 1.e-3 | 0.3 | 0.7 | 1. | 0 |

| VARIABLE | DESCRIPTION |
|----------|---|
| ITS | Maximum number of iterations to reach convergence. |
| TOL1/2/3 | Tolerance limits for the momentum pressure and temperature equations respectfully. |
| REL1/2 | Relaxation parameters for the velocity and pressure respectfully. Decreasing those values may add stability but more iterations may be needed to reach convergence. |
| UREL | Under relaxation parameter. Lowering this value may improve the final accuracy of the solution but more iterations may be needed to achieve convergence. |
| ORDER | Analysis order : |
| | EQ.0: Second order. More accurate but more time consuming. |
| | EQ.1: First order: More stable and faster but may be less accurate. |

7-54 (ICFD) LS-DYNA R12

*ICFD_CONTROL_SURFMESH

Purpose: This keyword enables automatic surface re-meshing. The objective of the remeshing is to improve the mesh quality on the boundaries. It should not be used on a regular basis.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|--------|---|---|---|---|---|---|
| Variable | RSRF | SADAPT | | | | | | |
| Туре | I | I | | | | | | |

| VARIABLE | DESCRIPTION |
|----------|--|
| RSRF | Indicates whether or not to perform a surface re-meshing. |
| | EQ.0: no re-meshing is applied. |
| | EQ.1: Laplacian smoothing surface remeshing |
| | EQ.2: Curvature preserving surface remeshing |
| SADAPT | Indicates whether or not to trigger adaptive surface remeshing. |
| | EQ.0: no adaptive surface re-meshing is applied. |
| | EQ.1: automatic surface remeshing when quality deteriorates (3D only). |
| | |

LS-DYNA R12 7-55 (ICFD)

*ICFD_CONTROL_TAVERAGE

Purpose: This keyword controls the restarting time for computing the time average values. By default, there is no restarting and the average quantities are given starting from t = 0. This keyword can be useful in turbulent problems that admit a steady state.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|---|---|---|---|---|---|---|
| Variable | DT | | | | | | | |
| Туре | F | | | | | | | |
| Default | none | | | | | | | |

| VARIABLE | DESCRIPTION |
|----------|---|
| DT | Over each DT time interval, the average quantities are reset. |

7-56 (ICFD) LS-DYNA R12

*ICFD_CONTROL_TIME

Purpose: This keyword is used to change the defaults related to time parameters in the fluid problem.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|----|-----|--------|-------|-------|--------|--------|
| Variable | TTM | DT | CFL | LCIDSF | DTMIN | DTMAX | DTINIT | TDEATH |
| Туре | F | F | F | I | F | F | F | F |
| Default | 1E28 | 0 | 1 | none | none | none | none | 1E28 |

| VARIABLE | DESCRIPTION |
|----------|--|
| TTM | Total time of simulation for the fluid problem. |
| DT | Time step for the fluid problem. If different from zero, the time step will be set constant and equal to this value. If $DT = 0$, then the time step is automatically computed based on the CFL condition. |
| CFL | CFL number for $DT = 0$. In general, CFL specifies a scale factor that is applied to the time step. When $DT = 0$, the time step is set to the maximum value satisfying the CFL condition, in which case this scale factor is equal to the <i>CFL number</i> . |
| LCIDSF | Load Curve ID specifying the CFL number when $DT = 0$ as a function of time, and more generally LCIDSF specifies the time step scale factor as the function of time. |
| DTMIN | Minimum time step. When an automatic time step is used and DTMIN is defined, the time step cannot drop below DTMIN. A negative value will refer to a time dependent load curve. |
| DTMAX | Maximum time step. When an automatic time step is used and DTMAX is defined, the time step cannot increase beyond DT-MAX. A negative value will refer to a time dependent load curve. |
| DTINIT | Initial time step. If not defined, the solver will automatically determine an initial timestep based on the flow velocity or dimensions of the problem in cases where there is no inflow. |

LS-DYNA R12 7-57 (ICFD)

TDEATH Death time for the Navier Stokes solve. After TDEATH, the velocity and pressure will no longer be updated. But the temperature and other similar quantities still can.

7-58 (ICFD) LS-DYNA R12

*ICFD_CONTROL_TRANSIENT

Purpose: This keyword allows to specify different integration scheme options for the transient solver.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |

7-60 (ICFD)

| VARIABLE | DESCRIPTION |
|----------|--|
| | EQ.0: Turbulence model based on a variational multiscale approach is used by default. |
| | EQ.1: RANS $k - \varepsilon$ approach (see Remark 1) |
| | EQ.2: LES Smagorinsky or dynamic sub-grid scale model |
| | EQ.3: LES Wall adapting local eddy-viscosity (WALE) model |
| | EQ.4: RANS k - w approach (see Remark 2) |
| | EQ.5: RANS Spalart-Allmaras approach |
| SUBMOD | Turbulence sub-model. |
| | For RANS k - ε approach (TMOD = 1): |
| | EQ.1: Standard model |
| | EQ.2: Realizable model |
| | For LES Smagorinsky or dynamic sub-grid model (TMOD = 2): |
| | EQ.1: Smagorinsky model (see Remark 6) |
| | EQ.2: Dynamic model (see Remark 7). |
| | For RANS k - ω approach (TMOD = 4): |
| | EQ.1: Standard Wilcox 98 model. |
| | EQ.2: Standard Wilcox 06 model. |
| | EQ.3: SST Menter 2003. |
| WLAW | Law of the wall ID if a RANS turbulence model is selected (see Remark 4): |
| | EQ.1: Standard classic law of the wall (default for $TMOD = 1$) |
| | EQ.2: Standard Launder and Spalding law of the wall |
| | EQ.4: Nonequilibrium Launder and Spalding law of the wall |
| | EQ.5: Automatic classic law of the wall |
| KS | Roughness physical height, only used for RANS turbulence models. |
| CS | Roughness constant, only used for RANS turbulence models. |
| TWLAW | Thermal law of the wall flag (see Remark 8): |
| | EQ.0: No thermal law of the wall activated. |
| CS | models. Roughness constant, only used for RANS turbulence models. Thermal law of the wall flag (see Remark 8): |

LS-DYNA R12 7-61 (ICFD)

VARIABLE DESCRIPTION

EQ.1: Thermal law of the wall

TYPLUS Thermal Y+ value (Y_{+t}) . If Y_{+t} is not defined, the solver will automatically estimate its value using $Y_{+tc} = Y_{+c}/\Pr^{1./3.}$ with

 $Y_{+c} = 11.225$ the critical Y_{+} value and Pr the Prandtl number.

RANS $k - \varepsilon$ Card. Optional card if TMOD = 1. Optional card read if TMOD = 1. See Remark 1.

DESCRIPTION

Remarks:

CW2

VARIARI F

1. $k - \varepsilon$ **Model (TMOD = 1).** For the Standard $k - \varepsilon$ model, the following two equations are solved for the turbulent kinetic energy (k) and the turbulent dissipation (ε):

$$\begin{split} \frac{\partial k}{\partial t} + \frac{\partial (ku_i)}{\partial x_i} &= \frac{\partial}{\partial x_j} \left[(\frac{\mu}{\rho} + \frac{\mu_t}{\rho \sigma_k}) \frac{\partial k}{\partial x_j} \right] + P_k + P_b - \varepsilon + S_k \\ \frac{\partial \varepsilon}{\partial t} + \frac{\partial (\varepsilon u_i)}{\partial x_i} &= \frac{\partial}{\partial x_i} \left[(\frac{\mu}{\rho} + \frac{\mu_t}{\rho \sigma_\varepsilon}) \frac{\partial \varepsilon}{\partial x_j} \right] + C_{1\varepsilon} \frac{\varepsilon}{k} P_k - C_{2\varepsilon} \frac{\varepsilon^2}{k} + S_e \end{split}$$

Here P_k is the k production term (see Remark 3), P_b is the production term due to buoyancy and S_k and S_e are the user defined source terms. P_k and P_b are expressed as:

$$P_{k} = \frac{\mu_{t}}{\rho} S^{2}$$

$$P_{b} = \frac{\beta \mu_{t}}{\rho \Pr_{t}} g_{i} \frac{\partial T}{\partial x_{i}}$$

where S is the modulus of the mean rate of strain tensor ($S^2 = 2S_{ij}S_{ij}$), β is the coefficient of thermal expansion, and \Pr_t is the turbulent Prandtl number. The turbulent viscosity is then expressed as:

$$\mu_t = \rho C_\mu \frac{k^2}{\varepsilon}$$

For the realizable k - ε model, the equation for the turbulent kinetic energy does not change, but the equation for the turbulent dissipation is now expressed as:

$$\frac{\partial \varepsilon}{\partial t} + \frac{\partial (\varepsilon u_i)}{\partial x_i} = \frac{\partial}{\partial x_j} \left[(\frac{\mu}{\rho} + \frac{\mu_t}{\rho \sigma_{\varepsilon}}) \frac{\partial \varepsilon}{\partial x_j} \right] + C_1 S \varepsilon - C_{2\varepsilon} \frac{\varepsilon^2}{k + \sqrt{\frac{\mu}{\rho} \varepsilon}} - \varepsilon + S_e .$$

Here $C_1 = \max\left[0.43, \frac{\eta}{\eta + 5}\right]$ with $\eta = S\frac{k}{\varepsilon}$.

Furthermore, while the turbulent viscosity is still expressed the same way, C_{μ} is no longer a constant:

$$C_{\mu} = \frac{1}{A_0 + A_s k \frac{U^*}{\epsilon}} \ .$$

In the above,

$$\begin{split} U^* &= \sqrt{\Omega_{ij}\Omega_{ij} + S_{ij}S_{ij}} \\ A_0 &= 4.04 \\ A_s &= \sqrt{6}cos\left(\frac{1}{3}cos^{-1}\left(\sqrt{6}\frac{S_{ij}S_{jk}S_{ki}}{(S_{ij}S_{ij})^{3/2}}\right)\right) \end{split}$$

Note that in this case, the constant value C_{μ} that can be input by you serves as the limiting value that C_{μ} can take. By default, $C_{\mu} = 0.09$ so:

$$0.0009 < C_{\mu} < 0.09$$

2. $k - \omega$ Model (TMOD = 4). For the Standard Wilcox 06 $k - \omega$ model, the following two equations are solved for the turbulent kinetic energy and the specific turbulent dissipation rate, respectively k and ω :

$$\begin{split} \frac{\partial k}{\partial t} + \frac{\partial (ku_i)}{\partial x_i} &= \frac{\partial}{\partial x_j} \left[\left(\frac{\mu}{\rho} + \frac{\mu_t}{\rho \sigma_{k1}} \right) \frac{\partial k}{\partial x_j} \right] + P_k - \beta^* k \omega + S_k \\ \frac{\partial \omega}{\partial t} + \frac{\partial (\omega u_i)}{\partial x_i} &= \frac{\partial}{\partial x_i} \left[\left(\frac{\mu}{\rho} + \frac{\mu_t}{\rho \sigma_{\omega 1}} \right) \frac{\partial \varepsilon}{\partial x_j} \right] + \gamma \frac{\omega}{k} P_k - \beta \omega^2 + \sigma_d X_k \omega^2 + S_\omega \end{split}$$

LS-DYNA R12 7-65 (ICFD)

Here P_k is the k production term (see Remark 3) and S_k and S_ω are the user defined source terms. P_k , β^* , β and σ_d are expressed as:

$$P_k = \frac{\mu_t}{\rho} S^2$$

$$\beta^* = \beta_0^* f_{\beta^*}$$

$$\beta = \beta_0 1 f_{\beta}$$

$$\sigma_d = \begin{cases} 0. & X_k \le 0. \\ 1/8 & X_k > 0. \end{cases}$$

where

$$f_{\beta} = \frac{1 + 85X_{\omega}}{1 + 100X_{\omega}}$$

$$f_{\beta*} = 1.$$

$$X_{k} = \frac{1}{\omega^{3}} \frac{\partial k}{\partial x_{j}} \frac{\partial \omega}{\partial x_{j}}$$

$$X_{\omega} = \left| \frac{\Omega_{ij} \Omega_{jk} S_{ki}}{(\beta_{0}^{*} \omega)^{3}} \right|$$

The turbulent viscosity is then:

$$\mu_t = \rho \frac{k}{\max \left[\omega, C_l \sqrt{\frac{2S_{ij}S_{ij}}{\beta_0^*}} \right]}$$

For the Standard Wilcox 98 model, the following terms are modified:

$$f_{\beta} = \frac{1 + 70X_{\omega}}{1 + 80X_{\omega}}$$

$$f_{\beta*} = \begin{cases} 1 & \text{if } X_k \le 0. \\ \frac{1 + 680X_k^2}{1 + 400X_k^2} & \text{if } X_k > 0. \end{cases}$$

$$\sigma_d = 0.$$

The turbulent viscosity is then:

$$\mu_t = \rho \frac{k}{\omega}$$

For the Menter SST 2003 model, the following equations are solved:

$$\begin{split} \frac{\partial k}{\partial t} + \frac{\partial (ku_i)}{\partial x_i} &= \frac{\partial}{\partial x_j} \left[(\frac{\mu}{\rho} + \frac{\mu_t}{\rho \, \sigma_k}) \, \frac{\partial k}{\partial x_j} \right] + P_k - \beta_0^* k \omega + S_k \\ \frac{\partial \omega}{\partial t} + \frac{\partial (\omega u_i)}{\partial x_i} &= \frac{\partial}{\partial x_j} \left[(\frac{\mu}{\rho} + \frac{\mu_t}{\rho \, \sigma_\omega}) \, \frac{\partial \varepsilon}{\partial x_j} \right] + \frac{\gamma}{\mu_t} P_k - \beta \omega^2 + 2(1 - F_1) \, \sigma_{\omega 2} X_k \omega^2 + S_\omega \end{split}$$

Each of the constants, γ , β , σ_k , and σ_{ω} are now computed by a blend of two constants with a blending function through:

$$\alpha = \alpha_1 F_1 + \alpha_2 (1 - F_1)$$

The blending function F_1 is defined by:

$$F_{1} = \tanh \left\langle \left[\min \left(\max \left(\frac{\sqrt{k}}{\beta_{0}^{*} \omega y}, \frac{500\nu}{y^{2} \omega} \right), \frac{4\rho \sigma_{\omega 2} k}{\text{CD} \times y^{2}} \right) \right]^{4} \right\rangle$$

With *y* the distance to the nearest wall and:

$$CD = \max(2\rho\sigma_{\omega 2}X_k\omega^2, 10^{-10})$$

The turbulent viscosity is then:

$$\mu_t = \rho \frac{a_1 k}{\max(a_1 \omega, S F_2)}$$

with:

$$F_2 = \tanh \left[\left(\max \left(\frac{2\sqrt{k}}{\beta_0^* \omega y}, \frac{500\nu}{y^2 \omega} \right) \right)^2 \right]$$

3. **Production Term.** You can activate a limiter on the production term, P_k , for TMOD =1 and 4. If $C_{\text{cut}} \ge 0$ (CCUT), then:

$$P_k = \begin{cases} \min(P_k, C_{\text{cut}} \varepsilon) & \text{if TMOD} = 1\\ \min(P_k, C_{\text{cut}} \beta_0^* k \omega) & \text{if TMOD} = 4 \end{cases}$$

This is especially common when using the Menter SST 2003 model.

- 4. **Laws of the Wall for RANS Models.** For RANS models, the following laws of the wall are available:
 - a) $Standard\ Classic\ (WLAW = 1)$.

$$U^{+} = \begin{cases} \frac{1}{\kappa} \ln(EY^{+}) & \text{if } Y^{+} > 11.225 \\ \frac{1}{\kappa} + \frac{\rho y U_{\tau}}{\mu} & \text{otherwise} \end{cases}$$

$$V^{+} = \frac{\frac{\rho y U_{\tau}}{\mu}}{U_{\tau}}$$

$$U^{+} = \frac{U}{U_{\tau}}$$

$$U_{\tau} = \sqrt{\frac{\tau_{w}}{\rho}}$$

This is the default for TMOD = 1.

b) Standard Launder and Spalding (WLAW = 2).

$$U^* = \begin{cases} \frac{1}{\kappa} \ln(EY^*) & \text{if } Y^* > 11.225\\ Y^* & \text{otherwise} \end{cases}$$

$$Y^* = \frac{\rho C_{\mu}^{-1/4} k^{1/2} y}{\mu}$$

$$U^* = \frac{U C_{\mu}^{-1/4} k^{1/2}}{U_{\tau}^{-2}}$$

$$U_{\tau} = \sqrt{\frac{\tau_{w}}{\rho}}$$

c) Nonequilibrium Launder and Spalding (WLAW = 3). The nonequilibrium laws of the wall modify the expression of the velocity at the wall making it sensitive to the pressure gradient:

$$\widetilde{U} = U - \frac{1}{2} \frac{dp}{dx} \left[\frac{y_v}{\rho \kappa \sqrt{k}} ln \left(\frac{y}{y_v} \right) + \frac{y - y_v}{\rho \kappa \sqrt{k}} + \frac{{y_v}^2}{\mu} \right]$$

with:

$$y_v = \frac{11.225}{y^*} y$$

This law is recommended with TMOD = 1 and in cases of complex flows involving separation, reattachment and recirculation.

d) Automatic Classic (WLAW = 4). The automatic wall law attempts to blend the viscous and log layers to better account for the transition zone. In the buffer region, we have :

$$U^{+} = \frac{U}{U_{\tau}}$$

$$U_{\tau} = \sqrt[4]{(\frac{U}{y^{+}})^{4} + (\frac{U}{\frac{1}{\kappa} \ln (Ey^{+})})^{4}}$$

This is the recommended approach for TMOD = 4.

5. **RANS Turbulence Model with Roughness Included.** When a RANS turbulence model is selected, it is possible to define extra parameters to account for roughness effects. In such cases, an extra term will be added to the logarithmic part of the different laws of the wall:

$$U^{+} = \frac{1}{\kappa} \ln(E Y^{+}) - \Delta B$$

If we introduce the non-dimensional roughness height:

$$K^+ = \frac{\rho K_s C_\mu^{\ 1/4} k^{1/2}}{\mu} \ ,$$

we have:

$$\Delta B = \begin{cases} 0 & \text{for } K^+ \leq 2.25 \\ \frac{1}{\kappa} \ln \left(\frac{K^{\pm 2.25}}{87.75} + C_s K^+ \right) \times \sin \left(0.4258 (\ln K^+ - 0.811) \right) & \text{for } 2.25 < K^+ \leq 90.0 \\ \frac{1}{\kappa} \ln (1 + C_s K^+) & \text{for } 90. < K^+ \end{cases}$$

6. **LES Smagorinksy.** The LES Smagorinsky turbulence model uses the Van Driest damping function close to the wall:

$$f_v = 1 - e^{-\frac{y^+}{A^+}}$$

- 7. **LES Dynamic Model.** The LES dynamic model is based on the model originally proposed by Germano et. al. (1991) and improved by Lilly (1992), with localization on Cs by Piomelli and Liu (1995).
- 8. **Thermal Law of the Wall.** When the thermal law of the wall is activated, the turbulent heat flux will be calculated as an additional output variable:

$$Q_t = \rho C_p \frac{U_\tau}{T_+} (T_s - T_c)$$

$$T_+ = \begin{cases} \Pr_t Y_+ & \text{if } Y_{+t} \le Y_{+tc} \\ \frac{\Pr_t}{\vartheta} \log(Y_+) + \left(3.85 \Pr_t^{1.\overline{3}} - 1.3\right)^2 + 2.12 \log(\Pr_t) & \text{otherwise} \end{cases}$$

LS-DYNA R12 7-69 (ICFD)

*ICFD_CONTROL_TURB_SYNTHESIS

Purpose: This keyword enables the user impose a divergence-free turbulent field on inlets.

Card must be used jointly with VAD = 4 of keyword *ICFD_BOUNDARY_PRESCRIBED_VEL.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-----|------------------|------------------|------|-----------|---|---|---|
| Variable | PID | IU | IV | IW | LS | | | |
| Туре | I | F | F | F | F | | | |
| Default | 0 | 10 ⁻³ | 10 ⁻³ | 10-3 | h_{min} | | | |

VARIABLE

DESCRIPTION

PID

Part ID of the surface with the turbulent velocity inlet condition.

IU, IV, IW

Intensity of field fluctuations over x, y, and z directions,

$$IU = \frac{u'}{u_{\text{avg}}}.$$

LS

Integral length scale of turbulence

Remarks:

1. If this card is not defined but a turbulent field inlet has been activated. See VAD = 4 of *ICFD_BOUNDARY_PRESCRIBED_VEL, the default parameters will be used.

*ICFD_DATABASE_AVERAGE

Purpose: This keyword enables the computation of time average variables at given time intervals.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|---|---|---|---|---|---|---|
| Variable | DT | | | | | | | |
| Туре | F | | | | | | | |
| Default | none | | | | | | | |

| VARIABLE | DESCRIPTION |
|----------|--|
| DT | Over each DT time interval, an average of the different fluid variables will be calculated and then reset when moving to the |
| | next DT interval. |

Remarks:

1. The file name for this database is icfdavg.*.dat with the different averaged variable values copied in a ASCII format.

LS-DYNA R12 7-71 (ICFD)

*ICFD_DATABASE_DRAG_{OPTION}

Available options include

VOL

Purpose: This keyword enables the computation of drag forces over given surface parts of the model. If multiple keywords are given, the forces over the PID surfaces are given in separate files and are also added and output in a separate file.

For the VOL option, drag calculation can also be applied on a volume defined by ICFD_PART_VOL. This is mostly useful in porous media applications to output the pressure drag of the porous media domain.

Surface Drag Cards. Include one card for each surface on which drag is applied. This input ends at the next keyword ("*") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|-------|--------|------|-------|-------|---|
| Variable | PID | CPID | DTOUT | PEROUT | DIVI | ELOUT | SS0UT | |
| Туре | I | I | F | I | I | I | I | |
| Default | none | none | 0. | 0 | 10 | 0 | 0 | |

| VARIABLE | DESCRIPTION |
|----------|--|
| PID | Part ID of the surface where the drag force will be computed. |
| CPID | Center point ID used for the calculation of the force's moment. By default the reference frame center is used is $0 = (0,0,0)$. |
| DTOUT | Time interval to print the output. If DTOUT is equal to 0.0, then the ICFD timestep will be used. |
| PEROUT | Outputs the contribution of the different elements on the total drag in fractions of the total drag in the d3plots. |
| DIVI | Number of drag divisions for PEROUT. Default is 10 which means the contributions will be grouped in 10 deciles. |
| ELOUT | Outputs the drag value of each element in the d3plots. |
| SSOUT | Outputs the pressure loads caused by the fluid on each solid segment set in keyword format. FSI needs to be activated. |

7-72 (ICFD) LS-DYNA R12

Remarks:

- 1. The file name for this database is icfdragi for instantaneous drag and icfdraga for the drag computed using average values of pressure and velocities.
- 2. The output contains:
 - a) "Fpx", "Fpy", and "Fpz" refer to the three components of the pressure drag force

$$\mathbf{F}_p = \int P dA,$$

where *P* is the pressure and *A* the surface area.

b) "Fvx", "Fxy", and "Fvz" refer to the three components of the viscous drag force

$$\mathbf{F}_v = \int \mu \frac{\partial \mathbf{u}}{\partial \mathbf{y}} d\mathbf{A}.$$

where $\frac{\partial \mathbf{u}}{\partial \mathbf{y}}$ is the shear velocity at the wall, μ is the viscosity and A is the surface area.

c) "Mpx", "Mpy", "Mpz", "Mvx", "Mvy", and "Mvz" refer to the three components of the pressure and viscous force moments respectively.

LS-DYNA R12 7-73 (ICFD)

*ICFD_DATABASE_FLUX

Purpose: This keyword enables the computation of the flow rate and average pressure over given parts of the model. If multiple keywords are given, separate files are output.

Include as many cards as needed. This input ends at the next keyword ("*") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|----------|---|---|---|---|---|---|
| Variable | PID | DTOUT | | | | | | |
| Туре | I | F | | | | | | |
| Default | none | ↓ | | | | | | |

| VARIABLE | DESCRIPTION |
|----------|--|
| PID | Part ID of the surface where the flow rates will be computed |
| DTOUT | Output frequency. Default is at every fluid timestep. |

Remarks:

- 1. **Database Name.** The file name for this database is icfd_flux.dat.
- 2. **Database Components.** The flux database contains the flow rate through a section, called "output flux,"

$$\Phi = \sum_{i} (\mathbf{V}_i \cdot \mathbf{n}_i) A_i \ ,$$

the average pressure, called "Pre-avg,"

$$P_{\text{avg}} = \frac{\sum_{i} P_{i} A_{i}}{\sum_{i} A_{i}} ,$$

and the total area, called "Areatot."

*ICFD_DATABASE_HTC

Purpose: This keyword allows the user to trigger the calculation of the Heat transfer coefficient using different methods and to control the output options.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-----|-----|----|---|---|---|---|-------|
| Variable | OUT | HTC | ТВ | | | | | OUTDT |
| Туре | I | I | F | | | | | F |
| Default | 0 | 0. | 0. | | | | | 0. |

| VARIABLE | ١ | | ٩I | RI | A | В | L | Е |
|-----------------|---|--|----|----|---|---|---|---|
|-----------------|---|--|----|----|---|---|---|---|

DESCRIPTION

OUT

Determines if the solver should calculate the heat transfer coefficient and how to output it:

EQ.0: No HTC calculation

EQ.1: HTC calculated and output in LSPP as a surface variable.

EQ.2: The solver will also look for FSI boundaries and output the HTC value at the solid nodes in an ASCII file called icfdhtci.dat.

EQ.3: The solver will also look for FSI boundaries that are part of SEGMENT_SETS and output the HTC for those segments in an ASCII file called icfd_convseg.****.key in a format that can directly read by LS-DYNA for a subsequent pure structural thermal analysis.

HTC Determines how the HTC is calculated.

EQ.0: Automatically calculated by the solver based on the average temperature flowing through the pipe section (See Remark 1).

EQ.1: User imposed value (See Remark 2).

TB Value of the bulk temperature if HTC = 1.

OUTDT Output frequency of the HTC in the various ASCII files. If left to 0., the solver will output the HTC at every timestep.

LS-DYNA R12 7-75 (ICFD)

Remarks:

- 1. The heat transfer coefficient is frequently used in thermal applications to estimate the effect of the fluid cooling and it derived from a CFD calculation.
- 2. The heat transfer coefficient is defined as follows:

$$h = \frac{q}{T_s - T_b}$$

with q the heat flux, T_s the surface temperature and T_b the so called "bulk" temperature. For external aerodynamic applications, this bulk temperature is often defined as a constant (ambient or far field conditions, HTC = 1). However, for internal aerodynamic application, this temperature is often defined as an average temperature flowing through the pipe section with the flow velocity being used as a weighting factor (HTC = 0).

*ICFD_DATABASE_NODEAVG

Purpose: This keyword enables the computation of the average quantities on surface nodes defined in *ICFD_DATABASE_NODOUT.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|----|---|---|---|---|---|---|---|
| Variable | ON | | | | | | | |
| Туре | I | | | | | | | |
| Default | 0 | | | | | | | |

| VARIABLE | DESCRIPTION |
|----------|---|
| ON | If equal to 1, the average quantities will be computed. |

Remarks:

1. The file name for this database is icfd_nodeavg.dat.

LS-DYNA R12 7-77 (ICFD)

*ICFD_DATABASE_NODOUT

Purpose: This keyword enables the output of ICFD data on surface nodes. For data in the fluid volume, it is advised to use points or tracers (See *ICFD_DATABASE_-POINTOUT).

Output Options Card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |

OUTLV Determines if the output file should be dumped. EQ.0: No output file is generated. EQ.1: The output file is generated. DTOUT Time interval to print the output. If DTOUT is equal to 0.0, then the ICFD timestep will be used. NID.. Node IDs.

Remarks:

1. The file name for this database is icfd_nodout.dat.

7-78 (ICFD) LS-DYNA R12

*ICFD_DATABASE_POINTAVG

Purpose: This keyword enables the computation of the average quantities on point sets using the parameters defined in *ICFD_DATABASE_POINTOUT.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|----|---|---|---|---|---|---|---|
| Variable | ON | | | | | | | |
| Туре | I | | | | | | | |
| Default | 0 | | | | | | | |

| VARIABLE | DESCRIPTION |
|----------|---|
| ON | If equal to 1, the average quantities will be computed. |

Remarks:

1. The file name for this database is icfd_psavg.dat.

LS-DYNA R12 7-79 (ICFD)

*ICFD_DATABASE_POINTOUT

Purpose: This keyword enables the output of ICFD data on points.

Output Options Card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|-------|--------|----|----|----|---|---|
| Variable | PSID | DTOUT | PSTYPE | VX | VY | VZ | | |
| Туре | I | F | I | F | F | F | | |
| Default | 0 | 0. | 0 | 0. | 0. | 0. | | |

Include as many cards as needed. This input ends at the next keyword ("*") card.

| Card 2 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|------|------|---|---|---|---|
| Variable | PID | Х | Y | Z | | | | |
| Туре | I | F | F | F | | | | |
| Default | none | none | none | none | | | | |

| VARIABLE | DESCRIPTION |
|------------|---|
| PSID | Point Set ID. |
| DTOUT | Time interval to print the output. If DTOUT is equal to 0.0, then the ICFD timestep will be used. |
| PSTYPE | Point Set type : |
| | EQ.0: Fixed points. |
| | EQ.1: Tracer points using prescribed velocity. |
| | EQ.2: Tracer points using fluid velocity. |
| | EQ.3: Tracer points using mesh velocity |
| VX, VY, VZ | Constant velocities to be used when PSTYPE = 1 |
| PID | Point ID |

7-80 (ICFD) LS-DYNA R12

| VARIABLE | DESCRIPTION |
|----------|---------------------------|
| X, Y, Z | Point initial coordinates |

Remarks:

1. The file name for this database is icfd_pointout.dat.

LS-DYNA R12 7-81 (ICFD)

*ICFD_DATABASE_RESIDUALS

Purpose: This keyword allows the user to output the residuals of the various systems.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|---|---|---|---|---|---|---|
| Variable | RLVL | | | | | | | |
| Туре | I | | | | | | | |
| Default | 0 | | | | | | | |

VARIABLE

DESCRIPTION

RLVL

Residual output level:

EQ.0: No output.

EQ.1: Only outputs the number of iterations needed for solving the pressure Poisson equation.

EQ.2: Outputs the number of iterations for the momentum, pressure, mesh movement and temperature equations.

EQ.3: Also gives the residual for each iteration during the solve of the momentum, pressure, mesh movement and temperature equations.

Remarks:

1. The file names for the momentum, pressure, mesh movement and temperature equations are called icfd_residuals.moms.dat, icfd_residuals.pres.dat, icfd_residuals.pres.dat, icfd_residuals.mmov.dat, and icfd_residuals.temp.dat respectively.

7-82 (ICFD) LS-DYNA R12

*ICFD_DATABASE_TEMP

Purpose: This keyword enables the computation of the average temperature and the heat flux over given parts of the model. If multiple keywords are given, separate files are output.

Include as many cards as needed. This input ends at the next keyword ("*") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|-------|---|---|---|---|---|---|
| Variable | PID | DTOUT | | | | | | |
| Туре | I | F | | | | | | |
| Default | none | none | | | | | | |

| VARIABLE | DESCRIPTION |
|----------|--|
| PID | Part ID of the surface where the average temperature and heat flux will be computed. |
| DTOUT | Output frequency. Default is at every fluid timestep. |

Remarks:

- 1. The file name for this database is icfd_thermal.dat.
- 2. Two average temperature are given in the icfd_thermal.dat file: "Temp-avg" and "Temp-sum". The average temperature is calculated using the local node area as weighting factor,

$$T_{\text{avg}} = \frac{\sum_{i}^{N} T_{i} A_{i}}{\sum_{i}^{N} A_{i}},$$

whereas, the sum is not weighted by area

$$T_{\text{sum}} = \frac{\sum_{i}^{N} T_{i}}{N}$$

If the mesh is regular, the two values will be of similar value. The icfd_thermal.dat output file also includes the average heat flux, the total surface area, and the average heat transfer coefficients (See *ICFD_DATABASE_HTC).

LS-DYNA R12 7-83 (ICFD)

*ICFD_DATABASE_TIMESTEP

Purpose: This keyword enables the output of ICFD data regarding the ICFD timestep.

Output Options Card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|---|---|---|---|---|---|---|
| Variable | OUTLV | | | | | | | |
| Туре | I | | | | | | | |
| Default | 0 | | | | | | | |

VARIABLE

DESCRIPTION

OUTLV

Determines if the output file should be dumped.

EQ.0: No output file is generated.

EQ.1: The output file is generated.

Remarks:

1. The file name for this database is icfd_tsout.dat.

2. Outputs the run's ICFD timestep versus the timestep calculated using the ICFD CFL condition as criteria (autotimestep). This can be useful in cases using a fixed timestep where big mesh deformations and/or big fluid velocity changes occur in order to track how that fixed timestep value compares to the reference autotimestep.

7-84 (ICFD) LS-DYNA R12

*ICFD_DATABASE_UINDEX

Purpose: This keyword allows the user to have the solver calculate the uniformity index (See Remark 1).

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-----|---|---|---|---|---|---|---|
| Variable | OUT | | | | | | | |
| Туре | I | | | | | | | |
| Default | 0 | | | | | | | |

VARIABLE

DESCRIPTION

OUT

Determines if the solver should calculate the uniformity index.

EQ.0: Off.

EQ.1: On.

Remarks:

1. **Uniformity Index.** The uniformity index is a post treatment quantity which measures how uniform the flow is through a given section. It is especially useful in internal aerodynamics cases. It is expressed as:

$$\gamma = 1 - \frac{1}{2nA} \sum_{i=1}^{n} \left[\frac{\sqrt{(u_i - \bar{u})^2}}{\bar{u}} A_i \right]$$

with A_i , the local cell area, A the total section area, u_i the local velocity, \bar{u} the average velocity through the section, and n the number of cells.

Values close to 0 means that the flow is very unevenly distributed. This can be used to identify bends, corners or turbulent effects. Values close to 1 imply smooth or equally distributed flow through the surface.

LS-DYNA R12 7-85 (ICFD)

*ICFD_DEFINE_HEATSOURCE

Purpose: This keyword defines a volumetric heat source for the heat equation solve.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|-------|------|-------|-------|---|---|
| Variable | HSID | LCID | SHAPE | R | PTID1 | PTID2 | | |
| Туре | I | I | I | F | I | I | | |
| Default | none | none | none | none | none | none | | |

| VARIABLE | DESCRIPTION |
|----------|---|
| HSID | Heat source ID. |
| LCID | Load curve ID specifying the evolution of the heat source term function of time for the X, Y and Z dofs, see *DE-FINE_CURVE,*DEFINE_CURVE_FUNCTION or *DE-FINE_FUNCTION. If a DEFINE_FUNCTION is used, the following parameters are allowed: $f(x,y,z,vx,vy,vz,temp,pres,time)$. |
| SHAPE | Shape of the volumetric heat source: |
| | EQ.1 : Box shape |
| | EQ.2 : Cylinder shape |
| | EQ.3 : Sphere shape |
| R | Radius of the sphere is $SHAPE = 3$ |
| PTID1 | ID of point (See ICFD_DEFINE_POINT) of minimum coordinates if SHAPE = 1, tail point if SHAPE = 2, origin if SHAPE = 3. |
| PTID2 | ID of point of maximum coordinates if $SHAPE = 2$, head point if $SHAPE = 2$. |

•

7-86 (ICFD) LS-DYNA R12

*ICFD_DEFINE_SOURCE

Purpose: Define a volumetric external force for the momentum equation solve.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|-------|------|-------|-------|---|---|
| Variable | SID | LCID | SHAPE | R | PTID1 | PTID2 | | |
| Туре | I | I | I | F | I | I | | |
| Default | none | none | none | none | none | none | | |

| VARIABLE | DESCRIPTION |
|----------|---|
| SID | Source ID |
| LCID | Load curve ID specifying the evolution of the volumetric force as a function of time |
| SHAPE | Shape to which the volumetric force is applied: EQ.1: Box EQ.2: Cylinder EQ.3: Sphere |
| R | Radius of the cylinder or sphere if $SHAPE = 2$ or 3 |
| PTID1 | Point ID (see *ICFD_DEFINE_POINT) whose meaning depends on SHAPE: SHAPE.EQ.1: Minimum coordinates of the box |
| | SHAPE.EQ.2: Tail point of the cylinder |
| | SHAPE.EQ.3: Origin of the sphere |
| PTID2 | Point ID (see *ICFD_DEFINE_POINT) whose meaning depends on SHAPE: |
| | SHAPE.EQ.1: Maximum coordinates of the box |
| | SHAPE.EQ.2: Head point of the cylinder |
| | |

LS-DYNA R12 7-87 (ICFD)

*ICFD_DEFINE_TURBSOURCE

Purpose: This keyword defines a external source for the RANS turbulent equations.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|-------|--------|--------|-------|------|-------|-------|
| Variable | TSID | LCIDK | LCIDEP | LCIDNU | SHAPE | R | PTID1 | PTID2 |
| Туре | I | I | I | I | I | F | I | I |
| Default | none | none | none | none | none | none | none | None |

| DESCRIPTION |
|-------------|
| |

TSID Turbulent external source ID.

LCIDK Load curve ID specifying the evolution of the external source term function of time for the turbulent kinetic

energy *k* equation, see *DEFINE_CURVE,*DEFINE_-CURVE_FUNCTION or *DEFINE_FUNCTION. If a DEFINE_FUNCTION is used, the following parameters are

allowed: f(x, y, z, vx, vy, vz, temp, pres, time).

LCIDEP Load curve ID specifying the evolution of the external source term function of time for the turbulent diffusion ε

or specific rate of dissipation w equation, see *DEFINE_-CURVE,*DEFINE_CURVE_FUNCTION or *DEFINE_-FUNCTION. If a DEFINE_FUNCTION is used, the

following parameters are allowed:

f(x,y,z,vx,vy,vz,temp,pres,time).

LCIDNU Load curve ID specifying the evolution of the external

source term function of time for the kinematic eddy turbulent viscosity equation used in the Spalart-Allmaras model, see *DEFINE_CURVE,*DEFINE_CURVE_FUNC-TION or *DEFINE_FUNCTION. If a DEFINE_FUNC-TION is used, the following parameters are allowed:

f(x,y,z,vx,vy,vz,temp,pres,time).

7-88 (ICFD) LS-DYNA R12

| VARIABLE | DESCRIPTION |
|----------|--|
| SHAPE | Shape of the external source: |
| | EQ.1: Box shape |
| | EQ.2 : Cylinder shape |
| | EQ.3 : Sphere shape |
| R | Radius of the sphere is $SHAPE = 3$ |
| PTID1 | ID of point (See ICFD_DEFINE_POINT) of minimum coordinates if SHAPE = 1, tail point if SHAPE = 2, origin if SHAPE = 3. |
| PTID2 | ID of point of maximum coordinates if $SHAPE = 2$, head point if $SHAPE = 2$. |

LS-DYNA R12 7-89 (ICFD)

*ICFD_DEFINE_POINT

Purpose: This keyword defines a point in space that could be used for multiple purposes.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|------|------|----------|---|---|---|
| Variable | POID | X | Υ | Z | CONSTPID | | | |
| Туре | 1 | F | F | F | I | | | |
| Default | none | none | none | none | none | | | |

Optional Card 2. Load curve IDS specifying velocity components of translating point

| Card 2 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|-------|-------|---|---|---|---|---|
| Variable | LCIDX | LCIDY | LCIDZ | | | | | |
| Type | I | I | I | | | | | |
| Default | 0 | 0 | 0 | | | | | |

Optional Card 3. Load curve IDS and rotation axis of rotating point

| Card 2 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|------|------|------|------|------|------|---|
| Variable | LCIDW | XT | YT | ZT | ХН | YH | ZH | |
| Type | I | F | F | F | F | F | F | |
| Default | 0 | none | none | none | none | none | none | |

| VARIABLE | DESCRIPTION |
|----------|------------------------------------|
| POID | Point ID. |
| X/Y/Z | x, y ,z coordinates for the point. |

7-90 (ICFD) LS-DYNA R12

| VARIABLE | DESCRIPTION | | | |
|-------------------|---|--|--|--|
| CONSTPID | Surface Part ID to which the point is constrained. This means that if the selected surface moves, then the localization of the point will update as well. | | | |
| LCIDX/LCIDY/LCIDZ | The point can be made to translate. Those are the three load curve IDs for the three translation components. | | | |
| LCIDW | The point can also be made to rotate. This load curve specifies the angular velocity. | | | |
| XT/YT/ZT | Rotation axis tail point coordinates. | | | |
| XH/YH/ZH | Rotation axis head point coordinates. | | | |
| | | | | |

LS-DYNA R12 7-91 (ICFD)

*ICFD_DEFINE_NONINERTIAL

Purpose: This keyword defines a non-inertial reference frame in order to avoid heavy mesh distortions and attendant remeshing associated with large-scale rotations. This is used to model, for example, spinning cylinders, wind turbines, and turbo machinery.

Include as many cards as needed. This input ends at the next keyword ("*") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|------|------|------|------|------|------|
| Variable | W1 | W2 | W3 | R | PTID | L | LCID | RELV |
| Туре | F | F | F | F | I | F | I | I |
| Default | none | 0 |

| VARIABLE | DESCRIPTION |
|------------|---|
| W1, W2, W3 | Rotational Velocity along the X,Y,Z axes |
| R | Radius of the rotating reference frame. If a negative value if given, then the absolute value will refer to a *DEFINE_FUNCTION ID. If a DEFINE_FUNCTION is used, the following parameters are allowed: $f(x, y, z, vx, vy, vz, temp, pres, time)$. |
| PTID | Starting point ID for the reference frame (See *ICFD_DEFINEPOINT) |
| L | Length of the rotating reference frame |

7-92 (ICFD) LS-DYNA R12

| VARIABLE | DESCRIPTION | | | | | |
|----------|---|--|--|--|--|--|
| LCID | Load curve for scaling factor of w. If a negative value is entered, then the absolute value will refer to a *DEFINE_FUNCTION ID. If a DEFINE_FUNCTION is used, the following parameters are allowed: $f(x,y,z,vx,vy,vz,temp,pres,time)$. | | | | | |
| RELV | Velocities computed and displayed: | | | | | |
| | EQ.0: Relative velocity, only the non-rotating components of the velocity are used and displayed. | | | | | |
| | EQ.1: Absolute velocity . All the components of the velocity are used. Useful in cases where several or at least one non-inertial reference frame is combined with an inertial "classical" reference frame. | | | | | |

Figure 7-2. Non Inertial Reference Frame Example

LS-DYNA R12 7-93 (ICFD)

*ICFD_DEFINE_WAVE_DAMPING

Purpose: This keyword defines a damping zone for free surface waves.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|---|----|----|---|------|---|
| Variable | PID | NID | L | F1 | F2 | N | LCID | |
| Туре | I | I | F | F | F | I | I | |
| Default | none | none | | 10 | 10 | 1 | none | |

| VARIABLE | DESCRIPTION | | | |
|----------|--|--|--|--|
| PID | Point ID defining the start of the damping layer. | | | |
| NID | Normal ID defined using ICFD_DEFINE_POINT and pointing to the outgoing direction of the damping layer. | | | |
| L | Length of damping layer. If no is value specified, the damping layer will have a length corresponding to five element lengths. | | | |
| F1/F2 | Linear and quadratic damping factor terms. | | | |
| N | Damping term factor. | | | |
| LCID | Load curve ID acting as temporal scale factor on damping term. | | | |

7-94 (ICFD) LS-DYNA R12

Remarks:

1. The damping is achieved by adding a source term to the momentum equations :

$$s^d = w \left(f_1 + f_2 |u| \right) u$$

with w the weight function :

$$w = \frac{e^{\gamma} - 1}{e - 1}$$

and γ the blending function which allows a smooth insertion of the source term in the damping layer :

$$\gamma = \left(\frac{x - x_{sd}}{x_{ed} - x_{sd}}\right)^n$$

 x_{sd} and x_{ed} representing the start and end coordinates of the damping zone.

*ICFD_INITIAL

*ICFD_INITIAL

Purpose: Simple initialization of velocity and temperature within a volume.

Include as many cards as needed. This input ends at the next keyword (" \ast ") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|------|------|------|------|---|-------|
| Variable | PID | Vx | Vy | Vz | Т | Р | | DFUNC |
| Туре | I | F | F | F | F | F | | I |
| Default | none | none | none | none | none | none | | 0 |

| VARIABLE | DESCRIPTION |
|----------|---|
| PID | Part ID for the volume elements or the surface elements where the values are initialized (see *ICFD_PART_VOL and *ICFDPART). PID = 0 to assign the initial condition to all nodes at once. |
| Vx | x coordinate for the velocity. |
| Vy | y coordinate for the velocity. |
| Vz | z coordinate for the velocity. |
| T | Initial temperature. |
| P | Initial Pressure. |
| DFUNC | Option to define initial conditions using *DEFINE_FUNCTION EQ.0: Turned off. |
| | EQ.1: Turned on. All previous flags for initial velocity, pressure and temperature now refer to *DEFINE_FUNCTION IDs. The following parameters are allowed: $f(x,y,z)$, allowing to define initial profiles function of coordinates. |

7-96 (ICFD) LS-DYNA R12

*ICFD_INITIAL_LEVELSET

Purpose: Instead of defining multiple fluid domain, it is possible to define an initial levelset surface via the introduction of this keyword (Replaces the need for *MESH_INTERF keyword).

Include as many cards as needed. This input ends at the next keyword ("*") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|------|------|------|------|------|------|--------|
| Variable | STYPE | NX | NY | NZ | Х | Y | Z | INVERT |
| Туре | I | F | F | F | F | F | F | I |
| Default | none | none | none | none | none | none | none | 0 |

| VARIABLE | DESCRIPTION | | | | | | | |
|----------|---|--|--|--|--|--|--|--|
| STYPE | Initial surface type: | | | | | | | |
| | EQ.0/1: Generated by a section plane | | | | | | | |
| | EQ.2: Generated by a box. See Remark 1. | | | | | | | |
| | EQ.3: Generated by a sphere. | | | | | | | |
| NX/NY/NZ | X, Y and Z components of the section plane normal if STYPE = 1. PMIN coordinates if STYPE = 2. NX is the sphere radius if STYPE = 3. | | | | | | | |
| X/Y/Z | X, Y and Z components of the section plane origin point if $STYPE = 1$. PMAX coordinates if $STYPE = 2$. Sphere origin point coordinates if $STYPE = 3$. | | | | | | | |
| INVERT | Inversion of initial levelset: | | | | | | | |
| | EQ.0: No inversion. Positive levelset values are assigned to nodes contained within the volume defined by STYPE. | | | | | | | |
| | EQ.1: The sign of the initial levelset values is reversed. | | | | | | | |

Remarks:

1. When STYPE = 2 is used and the box is adjacent to the fluid boundaries such as in dam breaking cases, it is important to define the Pmin coordinates far out-

LS-DYNA R12 7-97 (ICFD)

side the domain so that, at any point in the fluid, the distance to the fluid boundary remains smaller than the distance to the defined box.

Figure [1]. 2D Dam breaking example with initial levelset surface defined using STYPE = 2. Pmin is defined sufficiently far away from the fluid surface boundaries.

7-98 (ICFD) LS-DYNA R12

*ICFD_INITIAL_TURBULENCE

Purpose: When a RANS turbulent model is selected, it is possible to modify the default initial values of the turbulent quantities using this keyword.

Include as many cards as needed. This input ends at the next keyword ("*") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|------|---|---|---|---|---|
| Variable | PID | I | R | | | | | |
| Туре | I | F | F | | | | | |
| Default | none | none | none | | | | | |

| VARIABLE | DESCRIPTION |
|----------|---|
| PID | Part ID for the volume elements or the surface elements where the values are initialized (see *ICFD_PART_VOL and *ICFD_PART). PID = 0 to assign the initial condition to all nodes at once. |
| I | Initial turbulent intensity. |
| R | Initial turbulent viscosity to laminar viscosity ratio ($r = \frac{\mu_{turb}}{\mu}$). |

Remarks:

1. If no initial conditions have been assigned to a specific PID, the solver will automatically pick I=0.05 (5%) and R=10000.

LS-DYNA R12 7-99 (ICFD)

*ICFD_MAT

*ICFD_MAT_{OPTION}

Available options include

TITLE

Purpose: Specify physical properties for the fluid material.

Fluid Material Card Sets:

The Material Fluid Parameters Card is required. If a second card is given, it must be a Thermal Fluid Parameters Card. If the fluid thermal properties are not needed, the second card can be a blank card. With the third card, you can associate the fluid material to a non-Newtonian model and/or to a porous media model (see *ICFD_MOD-EL_NONNEWT and *ICFD_MODEL_POROUS).

Material Fluid Parameters Card.

VARIABLE DESCRIPTION

NNMOID Non-Newtonian Model ID.

NNID Non-Newtonian fluid model type:

EQ.1: Power-Law model

EQ.2: Carreau model

EQ.3: Cross model

EQ.4: Herschel-Bulkley model

EQ.5 : Cross II model

EQ.6: Sutherland formula for temperature dependent viscosity

EQ.7: Power-Law for temperature dependent viscosity

EQ.8: Viscosity defined by Load Curve ID or Function ID

LS-DYNA R12 7-103 (ICFD)

| VARIABLE | DESCRIPTION |
|----------|---|
| K | Consistency index if $NNID = 1$ and 4. Zero shear Viscosity if $NNID = 2.3$ and 5.Reference viscosity if $NNID = 6$ and $NNID = 7$. Load curve ID or function ID if $NNID = 8$. |
| N | Measure of the deviation of the fluid from Newtonian (Power Law index) for NNID = $1,2,3,4,5,7$. Not used for NNID = 6 and 8 . |
| MUMIN | Minimum acceptable viscosity value if NNID = 1. Infinite Shear Viscosity if NNID = 2.5 . Yielding viscosity if NNID = 4 .Not used if NNID = $3.6.7.8$. |
| LAMBDA | Maximum acceptable viscosity value if $NNID = 1$. Time constant if $NNID = 2$, 3, 5. Yield Stress Threshold if $NNID = 4$.Sutherland constant if $NNID = 6$. Not used if $NNID = 7.8$. |
| ALPHA | Activation energy if NNID = 1, 2. Not used if NNID = $3,4,5,6,7,8$. |
| TALPHA | Reference temperature if $NNID = 2$. Not used if $NNID = 1,3,4,5,6,7,8$ |

Remarks:

- 1. For the Non-Newtonian models, the viscosity is expressed as:
 - a) POWER-LAW:

$$\mu = k\dot{\gamma}^{n-1}e^{\alpha T_0/T}$$

$$\mu_{min} < \mu < \mu_{max}$$

With k the consistency index, n the power law index, α the activation energy, T_0 the initial temperature, T the temperature at any given time t, μ_{min} the minimum acceptable viscosity and μ_{max} the maximum acceptable viscosity.

b) CARREAU:

$$\mu = \mu_{\infty} + (\mu_0 - \mu_{\infty}) \big[1 + (H(T)\dot{\gamma}\lambda)^2 \big]^{(n-1)/2}$$

$$H(T) = exp\left[\alpha(\frac{1}{T - T_0} - \frac{1}{T_\alpha - T_0})\right]$$

With μ_{∞} the infinite shear viscosity, μ_0 the zero shear viscosity, n the power law index, λ a time constant, α the activation energy, T_0 the initial temperature, T

7-104 (ICFD) LS-DYNA R12

the temperature at any given time t and T_{α} the reference temperature at which H(T) = 1.

c) CROSS:

$$\mu = \frac{\mu_0}{1 + (\lambda \dot{\gamma})^{1-n}}$$

With μ_0 the zero shear viscosity, n the power law index and λ a time constant.

d) HERSCHEL-BULKLEY:

$$\mu = \mu_0 \text{ if } (\dot{\gamma} < \tau_0/\mu_0)$$

$$\mu = \frac{\tau_0 + k[\dot{\gamma}^n - (\tau_0/\mu_0)^n]}{\dot{\gamma}}$$

With k the consistency index, τ_0 the Yield stress threshold, μ_0 the yielding viscosity and n the power law index.

e) CROSS II:

$$\mu = \mu_{\infty} + \frac{\mu_0 - \mu_{\infty}}{1 + (\lambda \dot{\gamma})^n}$$

With μ_0 the zero shear viscosity, μ_∞ the infinite shear viscosity, n the power law index and λ a time constant.

- 2. For the temperature dependent viscosity models, the viscosity is expressed as:
 - a) SUTHERLAND's LAW:

$$\mu = \mu_0 (\frac{T}{T_0})^{3/2} \frac{T_0 + S}{T + S}$$

With μ_0 a reference viscosity, T_0 the initial temperature (which therefore must not be 0.), T the temperature at any given time t and S Sutherland's constant.

b) POWER LAW:

$$\mu = \mu_0 (\frac{T}{T_0})^n$$

With μ_0 a reference viscosity, T_0 the initial temperature (which therefore must not be 0.), T the temperature at any given time t and n the power law index.

*ICFD_MAT

3. For NNID = 8, a load curve function of time, a curve function or a function can be used. If it references a DEFINE_FUNCTION, the following arguments are allowed f(x, y, z, vx, vy, vz, temp, pres, shear, time).

7-106 (ICFD) LS-DYNA R12

*ICFD_MODEL_POROUS

Purpose: Specify a porous media model.

VARIABLE

DESCRIPTION

PMMOID

Porous media model ID

PMMTYPE

Porous media model type:

- EQ.1: Isotropic porous media Ergun correlation
- EQ.2: Isotropic porous media Darcy-Forchheimer model
- EQ.3: Isotropic porous media permeability defined through pressure-velocity data
- EQ.4: Anisotropic porous media. Fixed local reference frame (see Figure 7-3).
- EQ.5: Anisotropic porous media model moving local reference frame and permeability vector in local reference frame (x', y', z') defined by three pressure-velocity curves.
- EQ.6: Anisotropic porous media model moving local reference frame and permeability vector constant.
- EQ.7: Anisotropic porous media model moving local reference frame and permeability vector constant. This model differs from PMMTYPE = 6 in the way the local reference frame is moved.
- EQ.8: Main parachute model to be used jointly with *MESH_-EMBEDSHELL for the parachute surface. Similar to PMMTYPE = 2.
- EQ.10: Parachute model to be used jointly with *MESH_EMBEDSHELL where the fabric permeability and Forchheimer factor are computed from the pressure-velocity curves of experimental data given by a *LOAD_CURVE. Similar to PMMTYPE = 3.

7-108 (ICFD) LS-DYNA R12

VARIABLE

DESCRIPTION

EQ.11: Parachute model similar to PMMTYPE = 8, but pressure gradient is directly defined by coefficients α and β as:

$$\frac{\Delta P(u_x)}{\Delta x} = \alpha u_x + \beta u_x^2 \ .$$

Porous Media Parameters Card (PMMTYPE = 1, 2, and 8). This card is included PMMTYPE = 1, 2, or 8.

7-112 (ICFD) LS-DYNA R12

Figure 7-3. Anisotropic porous media vectors definition (PMMTYPE = 4, 5, 6, and 7). The vectors \mathbf{X} and \mathbf{Y} are the global axes; \mathbf{x}' and \mathbf{y}' define system for the primed coordinate(x', y', z').

VARIABLE

DESCRIPTION

*ICFD_DEFINE_POINT). Since those points can be made to move, it is therefore possible to define a moving reference frame for the anisotropic porous media domain.

Remarks:

1. **Generalized Flow Equations in a Porous Media.** Let ε be the porosity and κ be the permeability of the porous media. Then,

$$\varepsilon = \frac{\text{void volume}}{\text{total volume}} \ .$$

 u_i , the volume averaged velocity field, can then be defined in terms of the fluid velocity field, u_{if} , as:

$$u_i = \varepsilon u_{if}$$
.

The generalized flow equations of momentum and mass conservation can be expressed as:

$$\begin{split} \frac{\partial u_i}{\partial x_i} &= 0 \\ \frac{\rho}{\varepsilon} \left[\frac{\partial u_i}{\partial t} + \frac{\partial}{\partial x_j} (\frac{\partial u_i u_j}{\varepsilon}) \right] &= -\frac{1}{\varepsilon} \frac{\partial (P\varepsilon)}{\partial x_i} + \frac{\mu}{\varepsilon} \left(\frac{\partial^2 u_i}{\partial x_j \partial x_j} \right) + \rho g_i - D_i \end{split}$$

where D_i are the forces exerted on the fluid by the porous matrix (see Remarks 2 and 3).

LS-DYNA R12 7-113 (ICFD)

- 2. **Porous Forces for Isotropic Models.** For the isotropic model, the porous forces are a function of the matrix porosity and its permeability. For the isotropic case, three models are available:
 - a) Model 1 (Ergun correlation).

$$D_i = \frac{\mu u_i}{\kappa} + \frac{1.75\rho|U|}{\sqrt{150}\sqrt{\kappa}\varepsilon^{3/2}}u_i$$

b) Model 2 (Darcy-Forcheimer).

$$D_i = \frac{\mu u_i}{\kappa} + \frac{F \varepsilon \rho |U|}{\sqrt{\kappa}} u_i$$

- c) *Model 3.* Using the $\Delta P V$ experimental data. In this case, it is assumed that the pressure-velocity curve was obtained by applying a pressure difference or pressure drop on both ends of a porous slab of thickness Δx with porous properties κ and ε . It then becomes possible for the solver to fit that experimental curve with a quadratic polynomial of the form $\Delta P(u_x) = \alpha u_x^2 + \beta u_x$. Once α and β are known, it is possible to estimate D_i .
- 3. **Anisotropic Darcy-Forcheimer Term.** The anisotropic (see Figure 0-1) version of the Darcy-Forcheimer term can be written as:

$$D_{i} = \mu B_{ij} \mu_{j} + F \varepsilon |U| C_{ij} u_{j}$$

$$B_{ij} = (K_{ij})^{-1}$$

$$C_{ij} = (K_{ij})^{-1/2}$$

Here K_{ij} is the anisotropic permeability tensor.

*ICFD_PART_{OPTION}

Available options include

TITLE

Purpose: Define parts for this incompressible flow solver.

The TITLE option allows the user to define an additional optional line with a HEAD-ING in order to associate a name to the part.

| SID | Set ID |
| PID | Associated Part ID. |
| NID1, | Node IDs |

Remarks:

1. The convention is the similar to the one used by the keyword *SET_NODE_-LIST and serves a similar purpose.

LS-DYNA R12 7-119 (ICFD)

*ICFD_SOLVER_SPLIT

Purpose: This keyword provides an option to trigger an iterative procedure on the fluid system. This procedure aims to bring more precision to the final pressure and velocity values but is often very time consuming. It must therefore be used with caution. It is intended only for special cases. For stability purposes, this method is automatically used for the first ICFD time step.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-----|------------------|---|---|---|---|---|---|
| Variable | NIT | TOL | | | | | | |
| Туре | I | F | | | | | | |
| Default | 1 | 10 ⁻³ | | | | | | |

| VARIABLE | DESCRIPTION |
|----------|---|
| NIT | Maximum Number of iterations of the system for each fluid time step. If TOL criteria is not reached after NIT iterations, the run will proceed. |
| TOL | Tolerance Criteria for the pressure residual during the fluid system solve. |

7-120 (ICFD) LS-DYNA R12

*ICFD_SOLVER_TOL_FSI

Purpose: This keyword allows the user to change the default tolerance values for the Newton Raphson loop in the strong FSI analysis. *Care should be taken when deviating from the default values*.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |

| Variable | AT0L | RTOL | | MAXIT | | | | |
| Туре | F | F | | I | | | | |
| Default | 10-8 | 10-8 | | 1000 | | | | |

| VARIABLE | DESCRIPTION |
|----------|--|
| ATOL | Absolute convergence criteria. Convergence is achieved when $\operatorname{Residual}_{i+1} - \operatorname{Residual}_i \leq \operatorname{ATOL}$. If a negative integer is entered, then that value will be used as a load curve ID for ATOL. |
| RTOL | Relative convergence criteria. Convergence is achieved when $(Residual_{i+1} - Residual_i)/Residual_{initial} \le RTOL$. If a negative integer is entered, then that value will be used as a load curve ID for RTOL. |
| MAXIT | Maximum number of iterations allowed to achieve convergence. If a negative integer is entered, then that value will be used as a load curve ID for MAXIT. |

LS-DYNA R12 7-125 (ICFD)

*ICFD_SOLVER_TOL_PRE

Purpose: This keyword allows the user to change the default tolerance values for the Poisson equation for pressure. *Care should be taken when deviating from the default values.*

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------------------|------------------|---|-------|---|---|---|---|
| Variable | AT0L | RTOL | | MAXIT | | | | |
| Туре | F | F | | I | | | | |
| Default | 10 ⁻⁸ | 10 ⁻⁸ | | 1000 | | | | |

| VARIABLE | DESCRIPTION |
|----------|--|
| ATOL | Absolute convergence criteria. Convergence is achieved when $\operatorname{Residual}_{i+1} - \operatorname{Residual}_i \leq \operatorname{ATOL}$. If a negative integer is entered, then that value will be used as a load curve ID for ATOL. |

LS-DYNA R12 7-127 (ICFD)

*MESH

The keyword *MESH is used to create a mesh that will be used in the analysis. So far only tetrahedral (or triangular in 2-d) elements can be generated. The keyword cards in this section are defined in alphabetical order:

- *MESH_BL
- *MESH_BL_SYM
- *MESH_EMBEDSHELL
- *MESH_INTERF
- *MESH_NODE
- *MESH_SIZE_
- *MESH_SIZE_SHAPE
- *MESH_SURFACE_ELEMENT
- *MESH_SURFACE_NODE
- *MESH_VOLUME
- *MESH_VOLUME_ELEMENT
- *MESH_VOLUME_NODE
- *MESH_VOLUME_PART

LS-DYNA R12 8-1 (MESH)

*MESH_BL

*MESH_BL

Purpose: This keyword is used to define a boundary-layer mesh as a refinement on volume-mesh. The boundary layer mesh is constructed by subdividing elements near the surface.

Boundary Layer Cards. Define as many cards as are necessary. The next "*" card terminates the input.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|-------|------|------|------|---|---|---|
| Variable | PID | NELTH | BLTH | BLFE | BLST | | | |
| Туре | I | I | F | F | I | | | |
| Default | none | none | 0. | 0. | 0 | | | |

| VARIABLE | DESCRIPTION |
|----------|--|
| PID | Part identifier for the surface element. |
| NELTH | Number of elements normal to the surface (in the boundary layer) is NELTH+1. |
| BLTH | Boundary layer mesh thickness if $BLST = 1$ or $BLST = 2$. Growth scale factor if $BLST = 3$. Ignored if $BLST = 0$. |
| BLFE | Distance between the wall and the first volume mesh node if $BLST=3$. Scaling coefficient if $BLST=1$ or $BLST=2$. Ignored if $BLST=0$. |
| BLST | Boundary layer mesh generation strategy: |
| | EQ.0: Default. 2 ^{NELTH+1} subdivision based on surface mesh size. |
| | EQ.1: Power law using BLTH, and NELTH with BLFE as a scale factor. |
| | EQ.2: Geometric series based on BLTH and BLFE. |
| | EQ.3: Repartition following a growth scale factor (BLTH). |

8-2 (MESH) LS-DYNA R12

*MESH_BL *MESH

Remarks:

1. For BLST = 0, for every additional NELTH, the automatic volume mesher will divide the elements closest to the surface by two so that the smallest element in the boundary layer mesh will have an aspect ratio of $2^{\text{NELTH}+1}$. A default boundary layer mesh thickness based on the surface mesh size will be chosen.

2. For a constant repartition of the nodes in the boundary layer, use BLST = 1 with BLFE = 1. For BLST = 1, starting from the wall, the position of node n in the normal direction is given by :

Figure [1]. BLST = 1 example

3. Setting BLFE = 1 makes BLST = 2 equivalent to BLST = 0 except that BLST = 0 allows BLTH to be specified by the user instead of automatically using the local surface mesh size. For BLST = 2, starting from BLTH, each newly inserted node will have its location closer to the wall, following this law:

$$X_n = (0.5 \times BLFE)^n * BLTH * (1 - 0.5 * BLFE)$$

LS-DYNA R12 8-3 (MESH)

Figure [2]. BLST = 2 example

4. For BLST = 3, starting from the wall, the position of node n in the normal direction is given by :

$$X_n = \sum_{i=0}^n BLFE * BLTH^i \text{ with } 0 \le n \le NELTH$$

8-4 (MESH) LS-DYNA R12

*MESH_BL *MESH

Figure [3]. BLST = 3 example

LS-DYNA R12 8-5 (MESH)

*MESH *MESH_BL_SYM

*MESH_BL_SYM

Purpose: Specify the part IDs that will have symmetry conditions for the boundary layer. On these surfaces, the boundary layer mesh follows the surface tangent.

Boundary Layer with Symmetry Condition Cards. Define as many cards as necessary. The next "*" card terminates the input.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|------|------|------|------|------|------|
| Variable | PID1 | PID2 | PID3 | PID4 | PID5 | PID6 | PID7 | PID8 |
| Туре | I | I | I | I | I | I | I | I |
| Default | none |

| VARIABLE | DESCRIPTION | |
|----------|---|--------------------------|
| PID1, | Part identifiers for the surface element. | This is the surface with |
| | symmetry. | |

8-6 (MESH) LS-DYNA R12

*MESH_EMBEDSHELL

Purpose: Define surfaces that the mesher will embed inside the volume mesh. These surfaces will have no thickness and will conform to the rest of the volume mesh having matching nodes on the interface.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|---|---|---|---|---|---|---|
| Variable | VOLID | | | | | | | |
| Type | I | | | | | | | |
| Default | none | | | | | | | |

Define as many cards as are necessary based on the number of PIDs (the next "*" card terminates the input.)

| Card 2 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|------|------|------|------|------|------|
| Variable | PID1 | PID2 | PID3 | PID4 | PID5 | PID6 | PID7 | PID8 |
| Type | I | I | I | I | I | I | I | I |
| Default | none |

| VARIABLE | DESCRIPTION |
|----------|---|
| VOLID | ID assigned to the new volume in the keyword *MESH_VOL-UME. The surface mesh size will be applied to this volume. |
| PIDn | Part IDs for the surface elements that will be embedded in the volume mesh. |

LS-DYNA R12 8-7 (MESH)

*MESH_INTERF

*MESH_INTERF

Purpose: Define the surfaces that will be used by the mesher to specify fluid interfaces in multi-fluid simulations.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|---|---|---|---|---|---|---|
| Variable | VOLID | | | | | | | |
| Туре | I | | | | | | | |
| Default | none | | | | | | | |

Define as many cards as are necessary based on the number of PIDs. This input ends at the next keyword ("*") card.

| Card 2 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|------|------|------|------|------|------|
| Variable | PID1 | PID2 | PID3 | PID4 | PID5 | PID6 | PID7 | PID8 |
| Туре | I | I | I | I | I | I | I | I |
| Default | none |

| VARIABLE | DESCRIPTION |
|----------|--|
| VOLID | ID assigned to the new volume in the keyword *MESH_VOL-UME. The interface meshes will be applied to this volume. |
| PIDn | Part IDs for the surface elements. |

8-8 (MESH) LS-DYNA R12

*MESH_NODE *MESH

*MESH_NODE

Purpose: Define a fluid node and its coordinates. These nodes are used in the mesh generation process by the *MESH_SURFACE_ELEMENT keyword, or as user defined volume nodes by the *MESH_VOLUME_ELEMENT keyword.

Node Cards. Include one additional card for each node. This input ends at the next keyword ("*") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
|----------|------|---|---|---|---|---|---|---|---|----|
| Variable | NID |) | < | Υ | | Z | | | | |
| Туре | I | F | = | F | = | F | | | | |
| Default | none | (|) | (|) | (|) | | | |

| VARIABLE | DESCRIPTION |
|----------|---|
| NID | Node ID. A unique number with respect to the other surface nodes. |
| Χ | x coordinate. |
| Υ | y coordinate. |
| Z | z coordinate. |

Remarks:

- 1. The data card format for the *MESH_NODE keyword is identical to *NODE.
- 2. The *MESH_NODE keyword supersedes *MESH_SURFACE_NODE, which was for surfaces nodes as well as *MESH_VOLUME_NODE for, which was for volume nodes in user defined.

LS-DYNA R12 8-9 (MESH)

*MESH_SIZE

*MESH_SIZE

Purpose: Define the surfaces that will be used by the mesher to specify a local mesh size inside the volume. If no internal mesh is used to specify the size, the mesher will use a linear interpolation of the surface sizes that define the volume enclosure.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|---|---|---|---|---|---|---|
| Variable | VOLID | | | | | | | |
| Type | I | | | | | | | |
| Default | none | | | | | | | |

Define as many cards as are necessary based on the number of PIDs (the next "*" card terminates the input.).

| Card 2 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|------|------|------|------|------|------|
| Variable | PID1 | PID2 | PID3 | PID4 | PID5 | PID6 | PID7 | PID8 |
| Туре | I | I | I | I | I | I | I | 1 |
| Default | none |

| VARIABLE | DESCRIPTION |
|----------|---|
| VOLID | ID assigned to the new volume in the keyword *MESH_VOL-UME. The mesh sizing will be applied to this volume. |
| PIDn | Part IDs for the surface elements that are used to define the mesh size next to the surface mesh. |

8-10 (MESH) LS-DYNA R12

*MESH_SIZE_SHAPE *MESH

*MESH_SIZE_SHAPE

Purpose: Defines a local mesh size in specific zones corresponding to given geometrical shapes (box, sphere, cylinder and polynomial). The solver will automatically apply the conditions specified during the generation of the volume mesh. This zone does not need to be entirely defined in the volume mesh. In the polynomial case, it is recommended to define several zones for a better mesh size control.

Remeshing Control Card sets:

Add as many *remeshing control cards* paired with a *case card* as desired. The input of such pairs ends at the next keyword "*" card.

Remeshing Control. First card specifies whether to maintain this mesh sizing criterion through a remesh operation.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |

Card 2 for METHOD = 1

| Cards 2 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|--------|-------|-------|---|---|---|---|
| Variable | MSIZE | RADIUS | PTID1 | PTID2 | | | | |
| Туре | F | F | I | I | | | | |
| Default | none | none | none | none | | | | |

| DESCRIPTION |
|--|
| Shape name. Possibilities include "box", "cylinder", "pol" and "sphere" |
| Force to keep the mesh size criteria even after a remeshing is done. |
| EQ.0: Off, mesh size shape will be lost if a remeshing occurs |
| EQ.1: On. |
| Specifies which method to use when defining the second card. |
| EQ.0: Default, directly input the coordinates. |
| EQ.1: Define the coordinates via the introduction of ICFD_DE-FINE_POINT IDs. The biggest advantage of using this method is that the ICFD_DEFINE_POINTs are allowed to move which allows the user to control how the mesh size area should evolve function of time in cases where there is remeshing. |
| Birth and death time of the mesh size area in cases where remeshing occurs. |
| Mesh size that needs to be applied in the zone of the shape defined by SNAME |
| x, y , or z value for the point of minimum coordinates |
| x, y , or z value for the point of maximum coordinates |
| Coordinates of the sphere center in cases where SNAME is sphere |
| |

LS-DYNA R12 8-13 (MESH)

| VARIABLE | DESCRIPTION |
|----------|---|
| RADIUS | Radius of the sphere if SNAME is Sphere or of the cross section disk if SNAME is Cylinder. |
| X/Y/Z | Coordinates of starting point in cases where SNAME is pol. |
| NX/NY/NZ | Direction in which mesh size will be applied in cases where SNAME is pol. |
| PTID1 | Point ID1 referring to ICFD_DEFINE_POINT. Replaces PMIN, X/Y/Z or CENTER for the various SNAME cases. |
| PTID2 | Point ID2. Not needed if SNAME is Sphere. Replaces PMAX or NX/NY/NZ for the various SNAME cases. |

8-14 (MESH) LS-DYNA R12

*MESH_SURFACE_ELEMENT

Purpose: Specify a set of surface elements (quadrilateral or triangular in 3-d and linear segments in 2-d) that will be used by the mesher to construct a volume mesh. These surface elements may be used to define the enclosed volume to be meshed, or alternatively they could be used to apply different mesh sizes inside the volume (see card *MESH_SIZE).

Surface Element Card. Define as many cards as necessary. The next "*" card terminates the input.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
|----------|------|------|------|------|------|------|---|---|---|----|
| Variable | EID | PID | N1 | N2 | N3 | N4 | | | | |
| Туре | I | I | I | I | I | I | | | | |
| Default | none | none | none | none | none | none | | | | |

| VARIABLE | DESCRIPTION |
|----------|---|
| EID | Element ID. A unique number with respect to all *MESH_SUR-FACE_ELEMENTS cards. |
| PID | Mesh surface part ID. A unique identifier for the surface to which this mesh surface element belongs. |
| N1 | Nodal point 1. |
| N2 | Nodal point 2. |
| N3 | Nodal point 3. |
| N4 | Nodal point 4. |

Remarks:

1. The convention is the same used by the keyword *ELEMENT_SHELL. In the case of a triangular face N3 = N4. In 2-d N2 = N3 = N4. Note that the accepted card format is 6i8 (not 6i10)

LS-DYNA R12 8-15 (MESH)

*MESH_SURFACE_NODE

Purpose: Define a node and its coordinates. These nodes will be used in the mesh generation process by the *MESH_SURFACE_ELEMENT keyword.

*MESH_NODE supersedes this card; so please use *MESH_NODE instead of this card.

Surface Node Cards. Include one card for each node. Include as many cards a necessary. This input ends at the next keyword ("*") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
|----------|------|---|---|---|---|---|---|---|---|----|
| Variable | NID |) | X | | Υ | | Z | | | |
| Туре | I | F | = | F | | F | | | | |
| Default | none | (|) | (|) | (|) | | | |

| VARIABLE | DESCRIPTION |
|----------|---|
| NID | Node ID. This NID must be unique within the set of surface nodes. |
| Χ | <i>x</i> coordinate. |
| Y | y coordinate. |
| Z | z coordinate. |

8-16 (MESH) LS-DYNA R12

*MESH_VOLUME *MESH

*MESH_VOLUME

Purpose: This keyword defines the volume space that will be meshed. The boundaries of the volume are the surfaces defined by *MESH_SURFACE_ELEMENT. The surfaces listed have to be non-overlapping, and should not leave any gaps or open spaces between the surface boundaries. On the boundary between two neighbor surfaces, nodes have to be in common (no duplicate nodes) and should match exactly on the interface. They are defined by the keyword *MESH_SURFACE_NODE. This card will be ignored if the volume mesh is specified by the user and not generated automatically.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|---|---|---|---|---|---|---|
| Variable | VOLID | | | | | | | |
| Туре | I | | | | | | | |
| Default | none | | | | | | | |

Define as many cards as are necessary based on the number of PIDs (the next "*" card terminates the input.)

| Card 2 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|------|------|------|------|------|------|
| Variable | PID1 | PID2 | PID3 | PID4 | PID5 | PID6 | PID7 | PID8 |
| Туре | I | I | I | I | I | I | I | I |
| Default | none |

| VARIABLE | DESCRIPTION |
|----------|---|
| VOLID | ID assigned to the new volume. |
| PIDn | Part IDs for the surface elements that are used to define the volume. |

LS-DYNA R12 8-17 (MESH)

*MESH_VOLUME_ELEMENT

Purpose: Specify a set of volume elements for the fluid volume mesh in cases where the volume mesh is specified by the user and not generated automatically. The nodal point are specified in the *MESH_VOLUME_NODE keyword. Only tetrahedral elements are supported (triangles in 2D).

Volume Element Card. Define as many cards as necessary. The next "*" card terminates the input.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
|----------|------|------|------|------|------|------|---|---|---|----|
| Variable | EID | PID | N1 | N2 | N3 | N4 | | | | |
| Туре | I | I | 1 | I | I | I | | | | |
| Default | none | none | none | none | none | none | | | | |

| VARIABLE | DESCRIPTION |
|----------|---|
| EID | Element ID. A unique number with respect to all *MESH_VOL-UME_ELEMENTS cards. |
| PID | Part ID. A unique part identification number. |
| N1 | Nodal point 1. |
| N2 | Nodal point 2. |
| N3 | Nodal point 3. |
| N4 | Nodal point 4. |

Remarks:

1. The convention is the same used by the keyword *ELEMENT_SOLID.

8-18 (MESH) LS-DYNA R12

*MESH_VOLUME_NODE

Purpose: Define a node and its coordinates. This keyword is only used in cases where the fluid volume mesh is provided by the user and is not automatically generated. It serves the same purpose as the *NODE keyword for solid mechanics. Only tetrahedral elements are supported.

*MESH_NODE supersedes this card; so please use *MESH_NODE instead of this card.

Volume Node Cards. Include as many cards in the following format as desired. This input ends at the next keyword ("*") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
|----------|------|---|---|---|---|---|---|---|---|----|
| Variable | NID |) | < | ١ | (| 7 | 7 | | | |
| Туре | 1 | F | Ξ | F | = | F | = | | | |
| Default | none | (|) | (|) | (|) | | | |

| VARIABLE | DESCRIPTION |
|----------|--|
| NID | Node ID. A unique number with respect to the other volume nodes. |
| X | x coordinate. |
| Y | y coordinate. |
| Z | z coordinate. |

LS-DYNA R12 8-19 (MESH)

*MESH_VOLUME_PART

Purpose: Associate a volume part number created by a *MESH_VOLUME card with the part number of a part card from a selected solver (designated by the SOLVER field).

Mesh Volume Part Card. Include as many cards in the following format as desired. This input ends at the next keyword ("*") card.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|--------|--------|--------|---|---|---|---|---|
| Variable | VOLPRT | SOLPRT | SOLVER | | | | | |
| Туре | I | I | А | | | | | |
| Default | | | | | | | | |

| VARIABLE | DESCRIPTION |
|----------|--|
| VOLPRT | Part ID of a volume part created by a *MESH_VOLUME card. |
| SOLPRT | Part ID of a part created using SOLVER's part card. |
| SOLVER | Name of a solver using a mesh created with *MESH cards. |

8-20 (MESH) LS-DYNA R12

*STOCHASTIC

The keyword *STOCHASTIC is used to describe the particles and numerical details for solving a set of stochastic PDEs. Currently, there are two types of stochastic PDE models in the code: a spray model and a model of embedded particles in TBX explosives. The keyword cards for using these models are:

*STOCHASTIC_SPRAY_PARTICLES

*STOCHASTIC_TBX_PARTICLES

An additional option "_TITLE" may be appended to all *STOCHASTIC keywords. If this option is used, then an 80 character string is read as a title from the first card of that keyword's input. At present, LS-DYNA does not make use of the title. Inclusion of titles gives greater clarity to input decks.

LS-DYNA R12 9-1 (STOCHASTIC)

*STOCHASTIC_SPRAY_PARTICLES

Purpose: Specify particle and other model details for spray modeling using stochastic PDEs that approximate such processes. A pair of cards is required to specify the characteristics of each nozzle (cards 3 and 4 describe the first nozzle).

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |

| IDFUEL | Selected spra | ay liquid fuels: |
| | EQ.1: | (Default), H ₂ O |
| | EQ.2: | Benzene, C ₆ H ₆ |
| | EQ.3: | Diesel # 2, $C_{12}H_{26}$ |
| | EQ.4: | Diesel # 2, $C_{13}H_{13}$ |
| | EQ.5: | Ethanol, C_2H_5OH |
| | EQ.6: | Gasoline, C_8H_{18} |
| | EQ.7: | Jet-A, $C_{12}H_{23}$ |
| | EQ.8: | Kerosene, $C_{12}H_{23}$ |
| | EQ.9: | Methanol, CH ₃ OH |
| | EQ.10: | N-dodecane, $C_{12}H_{26}$ |
| RHOP | Particle dens | sity |
| TIP | Initial partic | le temperature. |
| PMASS | Total particle | e mass |
| PRTRTE | Number of p | particles injected per second for continuous injection. |
| STRINJ | Start of injec | tion(s) |
| DURINJ | Duration of | injection(s) |
| XORIG | X-coordinate | e of center of a nozzle's exit plane |
| YORIG | Y-coordinate | e of center of a nozzle's exit plane |
| ZORIG | Z-coordinate | e of center of a nozzle's exit plane |
| SMR | Sauter mean | radius |
| VELINJ | Injection vel | ocity |
| DRNOZ | Nozzle radiı | 1S |
| DTHNOZ | | angle (in degrees measured counterclockwise) of the zle from the $j=1$ plane. |

9-4 (STOCHASTIC) LS-DYNA R12

| VARIABLE | DESCRIPTION |
|----------|---|
| TILTXY | Rotation angle (in degrees) of the injector in the x-y plane, where 0.0 points towards the 3 o'clock position (j = 1 line), and the angle increases counterclockwise from there. |
| TILTXZ | Inclination angle (in degrees) of the injection in the x-z plane, where 0.0 points straight down, $x > 0.0$ points in the positive x direction, and $x < 0.0$ points in the negative x direction. |
| CONE | Spray mean cone angle (in degrees) for hollow cone spray; spray cone angle (in degrees) for solid cone spray. |
| DCONE | Injection liquid jet thickness in degrees. |
| ANOZ | Area of injector |
| AMP0 | Initial amplitude of droplet oscillation at injector |

Remarks:

1. When IEVAP = 1, the keyword input file must be modified in a fashion similar to a chemistry problem. This is illustrated in a portion of an example keyword file below. That is, the following keywords need to be used, along with the inclusion of other chemistry-related files (i.e. evap.inp and the corresponding thermodynamics data file):

```
*CHEMISTRY_MODEL
```

9-6 (STOCHASTIC) LS-DYNA R12

*STOCHASTIC_TBX_PARTICLES

Purpose: Specify particle and other model details for stochastic PDEs that model embedded particles in TBX explosives. Note that the components listed on the corresponding *CHEMISTRY_COMPOSITION card are in terms of molar concentrations of the species (in units of moles/[length]³, where "[length]" is the user's length unit).

For further information on the theory of the TBX model that has been implemented, a document on this topic can be found at this URL:

http://www.lstc.com/applications/cese_cfd/documentation

| VARIABLE | DESCRIPTION |
|----------|---|
| PCOMB | Particle combustion model |
| | EQ.0: no burning |
| | EQ.1: K-model |
| NPRTCL | Initial total number of parent particles (discrete particles for calculation) |
| MXCNT | Maximum allowed number of parent particles (during the simulation) |
| PMASS | Total particle mass |
| SMR | Sort mean particle radius |
| RHOP | Particle density |
| TICP | Initial particle temperature |
| T_IGNIT | Particle ignition temperature |
| INITDST | Initial particle distribution |
| | EQ.1: spatially uniform |
| | EQ.2: Rosin-Rammler |
| | EQ.3: Chi-squared |
| AZIMTH | Angle in degrees from x -axis in x - y plane of reference frame of TBX explosive (0 < AZMITH < 360) |
| ALTITD | Angle in degrees from z -axis of reference frame of TBX explosive (0 < ALTITD < 180) |
| CPS/CVS | Heat coefficient |

| VARIABLE | DESCRIPTION |
|----------|--|
| HVAP | Latent heat of vaporization |
| EMISS | Particle emissivity |
| BOLTZ | Boltzmann coefficient |
| XORIG | <i>x</i> -coordinate of the origin of the initial reference frame of the TBX explosive |
| YORIG | <i>y</i> -coordinate of the origin of the initial reference frame of the TBX explosive |
| ZORIG | z-coordinate of the origin of the initial reference frame of the TBX explosive |
| XVEL | <i>x</i> -component of the initial particle velocity the TBX explosive |
| YVEL | y-component of the initial particle velocity the TBX explosive |
| ZVEL | z-component of the initial particle velocity the TBX explosive |
| FRADIUS | Radius of the explosive area. |

Remarks:

1. If radiation heat transfer is being modeled, then EMISS and BOLTZ are required.

LS-DYNA R12 9-9 (STOCHASTIC)

*LSO

These cards provide a general data output mechanism, causing the creation of a sequence of LSDA files. This facility is intended to allow several different time sequences of data to be output in the same simulation. In addition, any number of domains (and any number of variables on those domains) may be specified within each time sequence. The keyword cards in this section are defined in alphabetical order:

*LSO_DOMAIN

*LSO_ID_SET (not available in the single-precision version of LS-DYNA)

*LSO_POINT_SET

*LSO_TIME_SEQUENCE

*LSO_VARIABLE_GROUP

Note that only the mechanics solver is available in the single-precision version of LS-DYNA, and therefore, only LSO mechanics variables are available for output from single precision LS-DYNA. These mechanics variables are listed by domain type in a separate document. This document (LSO_VARIABLES.TXT) is created by running the command: LS-DYNA print_lso_doc. Contrary to LSO_VARIABLES.TXT, element quantities such as stress are not available for output from the mechanics solver to the "lso" database.

An additional option "_TITLE" may be appended to all *LSO keywords. If this option is used, then an 80 character string is read as a title from the first card of that keyword's input. At present, LS-DYNA does not make use of the title. Inclusion of titles gives greater clarity to input decks.

LS-DYNA R12 10-1 (LSO)

*LSO_DOMAIN

*LSO_DOMAIN

Purpose: This command provides a way to specify variables on a subset of the domain for a given solver. This domain can be a subset of the mesh used by that solver, a set of output points created with *LSO_POINT_SET, or a set of objects created with *LSO_-ID_SET. The frequency and duration of the output for any given domain is determined by each *LSO_TIME_SEQUENCE card that references this *LSO_DOMAIN card. Note that for the single-precision version of LS-DYNA, the only allowed value of SOLVER_-NAME = MECH.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | | |

Variable Name Card. Provide as many cards as necessary. This input ends at the next keyword ("*") card

| Card 4 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | |
|----------|---|---------------|---|---|---|---|---|---|--|
| Variable | | VARIABLE_NAME | | | | | | | |
| Туре | | | | ļ | A | | | | |

| VARIABLE | DESCRIPTION |
|-------------|--|
| DOMAIN_TYPE | The type of domain for which LSO output may be generated. |
| SOLVER_NAME | Selects the solver from which data is output on this domain. Accepted entries so far are "MECH", "EM", "CESE", and "ICFD". |
| OUTID | LSO domain ID associated with this domain, and used by *LSO_TIME_SEQUENCE cards. |
| REFID | Support set ID. This can be a set defined by a *SET card, a *LSO_ID_SET, card, or a *LSO_POINT_SET card. Unless OVERRIDE is specified, this set must be of the same type as DOMAIN_TYPE. |
| OVERRIDE | If non-zero, then REFID is interpreted as: |
| | EQ.1: a PART set for SOLVER_NAME |
| | EQ.2: a PART set of volume parts created with a *LSOID_SET card (volume parts are defined with |

LS-DYNA R12 10-3 (LSO)

Table 10-1. Selected LSO Varriables

VARIABLE

DESCRIPTION

*MESH_VOLUME cards).

EQ.3: a PART set of surface parts created with a *LSO_-ID_SET card (surface parts are defined with *MESH_SURFACE_ELEMENT cards).

EQ.4: a set of segment sets created with a *LSO_ID_SET card.

REDUCT

A function that operates on the entire domain and returns a single value for scalar variables, three values for vector variables, or 6 values for symmetric tensor variables. For REDUCT="range", the number of returned values doubles. The following are the supported functions:

EQ.BLANK: no reduction (default)

EQ."none": Same as above

EQ. "avg": the average by component

EQ. "average": Same as above

EQ."min": the minimum by component

EQ."minimum": Same as above

EQ."max": the maximum by component

EQ. "maximum": Same as above

EQ."sum": the sum by component

10-4 (LSO) LS-DYNA R12

*LSO_DOMAIN *LSO

| VARIABLE | DESCRIPTION | | | | |
|---------------|---------------------------------|---|--|--|--|
| | EQ."range": | the minimum by component followed by the maximum by component | | | |
| VARIABLE_NAME | Either the name group. See rema | of a single output variable or a variable rks. | | | |

Remarks:

1. Supported choices for VARIABLE_NAME are listed by DOMAIN_TYPE for each SOLVER_NAME in a separate document. This document (LSO_VARIABLES.TXT) is created by running the command: LS-DYNA print_lso_doc. The following table shows a sample of the point output variables available when DOMAIN_TYPE = THIST_POINT:

LS-DYNA R12 10-5 (LSO)

*LSO_ID_SET

*LSO_ID_SET

Purpose: Provides a way to create a set of existing sets (segment sets), or to define a set that is not available with other set-related keyword cards. These are then used in other *LSO cards to specify LSO output. This card is not available in the single precision version of LS-DYNA.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|------|--------|---|---|---|---|---|
| Variable | SETID | TYPE | SOLVER | | | | | |
| Туре | 1 | Α | А | | | | | |
| Default | none | none | MECH | | | | | |

Referenced IDs. Provide as many cards as necessary. This input ends at the next keyword ("*") card

| Card | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|------|------|------|------|------|------|

| Default | none |

| VARIABLE | DESCRIPTION | |
|----------|-----------------------------|--|
| SETID | Identifier for this ID set. | |

10-6 (LSO) LS-DYNA R12

*LSO_ID_SET *LSO

| VARIABLE | | DESCRIPTION |
|----------|-------------------------|---|
| TYPE | The kind of IDs in this | set: |
| | EQ.'SEG_SETS': | Each ID is a segment set connected with SOLVER. |
| | EQ.'CIRCUIT': | Each ID is a circuit ID (from *EM cards) |
| | EQ.'SURF_PARTS': | Each ID is a surface part number (See *MESH_SURFACE_ELEMENT) |
| | EQ.'VOL_PARTS': | Each ID is a volume part number (See *MESH_VOLUME) |
| | EQ.'SURF_ELES': | Each ID is a surface element number (See *MESH_SURFACE_ELEMENT) |
| SOLVER | Name of the solver (M | IECH, ICFD, CESE, EM,) |
| ID1, | IDs of the TYPE kind. | |

LS-DYNA R12 10-7 (LSO)

*LSO_POINT_SET

Purpose: Define a list of points used to sample variables in time. Of the different sampling methods, the most common one is to specify points for time history output.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-------|-----|---|---|---|---|---|---|
| Variable | SETID | USE | | | | | | |
| Туре | I | I | | | | | | |
| Default | none | 1 | | | | | | |
| Remarks | | 1 | | | | | | |

Point Cards. Provide as many cards as necessary. This input ends at the next keyword ("*") card

| Card 2 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|------|------|------|---|---|---|---|---|
| Variable | Х | Υ | Z | | | | | |
| Туре | F | F | F | | | | | |
| Default | none | none | none | | | | | |

| VARIABLE | DESCRIPTION | | | | | | | |
|----------|---|--|--|--|--|--|--|--|
| SETID | Identifier for this point set which is used by *LSO_DOMAIN | | | | | | | |
| USE | Points in this set are used as: | | | | | | | |
| | EQ.1: fixed time history points (default) | | | | | | | |
| | EQ.2: positions of tracer particles | | | | | | | |
| X, Y, Z | Coordinates of a point. As many points as desired can be specified. | | | | | | | |

10-8 (LSO) LS-DYNA R12

*LSO_POINT_SET *LSO

Remarks:

1. **USE.** For USE = 1, with the ICFD and CESE solvers, the fixed points must remain inside the fluid mesh or a zero result is returned, while for the EM solver, the points can be defined inside the conductors or in the air. In the latter case, the fields will be computed using a Biot-Savart type integration. For USE = 2, a massless tracer particle is tracked for the ICFD and CESE solvers using their local velocity field to integrate the position of each particle in time.

LS-DYNA R12 10-9 (LSO)

*LSO_TIME_SEQUENCE

Purpose: This command provides users with maximum flexibility in specifying exactly what they want to have appear in the output LSO binary database. Each instance of the *LSO_TIME_SEQUENCE command creates a new time sequence with an independent output frequency and duration. Furthermore, while the default domain for each output variable will be the entire mesh on which that variable is defined, at all selected snapshot times, the *LSO_DOMAIN keyword commands can be used to specify that output will only occur on a portion of SOLVER_NAME's mesh, and for a limited time interval, or that it will occur at a set of points (see *LSO_POINT_SET), or over a set of object IDs (see *LSO_ID_SET). Note that for the single-precision version of LS-DYNA, the only allowed value of SOLVER_NAME = MECH.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | | |
|----------|---|-------------|---|---|---|---|---|---|--|--|
| Variable | | SOLVER_NAME | | | | | | | | |
| Туре | | | | A | 4 | | | | | |

| Card 2 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|-----|------|-------|-------|------|------|---|---|
| Variable | DT | LCDT | LCOPT | NPLTC | TBEG | TEND | | |
| Туре | F | I | I | I | F | F | | |

| Remarks | 1 | 1 | 1 | 1 | | | | |

10-10 (LSO) LS-DYNA R12

Domain IDs. Provide as many cards as necessary. This input ends at the next keyword ("*") card, or when a global variable name card appears

| Card 3 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|--------|--------|--------|--------|--------|--------|--------|--------|
| Variable | DOMID1 | DOMID2 | DOMID3 | DOMID4 | DOMID5 | DOMID6 | DOMID7 | DOMID8 |
| Туре | I | I | I | I | I | I | I | I |
| Default | none |

Global variable names. Provide as many cards as necessary. This input ends at the next keyword ("*") card

| Card 4 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|---|------------|---|---|---|---|---|---|
| Variable | | GLOBAL_VAR | | | | | | |
| Туре | A | | | | | | | |

| VARIABLE | DESCRIPTION |
|------------------|---|
| SOLV- ER_NAME | Selects the solver from which data is output in this time sequence. Accepted entries so far are 'MECH', 'EM', 'CESE' and 'ICFD' |
| DT | Time interval between outputs. |
| LCDT | Optional load curve ID specifying the time interval between dumps. |
| LCOPT | Flag to govern behavior of plot frequency load curve: |
| | EQ.1: At the time each plot is generated, the load curve value is added to the current time to determine the next plot time (this is the default behavior). |
| | EQ.2: At the time each plot is generated, the next plot time T is computed so that T = the current time plus the load curve value at the time T. |
| | EQ.3: A plot is generated for each ordinate point in the load curve definition. The actual value of the load curve is ignored. |

LS-DYNA R12 10-11 (LSO)

| VARIABLE | DESCRIPTION |
|------------|---|
| NPLTC | DT = ENDTIM/NPLTC overrides DT specified in the first field. |
| TBEG | The problem time at which to begin writing output to this time sequence |
| TEND | The problem time at which to terminate writing output to this time sequence |
| DOMID1, | Output set ID defining the domain over which variable output is to be performed in this time sequence. Each DOMID refers to the domain identifier in an *LSO_DOMAIN keyword card. |
| GLOBAL_VAR | The name of a global output variable computed by SOLVERNAME. This variable must have a single value (scalar, vector, or tensor), and therefore does not depend upon any DOMID. Any number of such variables may be specified with a given time sequence. These variables are listed as having "global" domain for SOLVER_NAME in a separate document. This document (LSO_VARIABLES.TXT) is created by running the command: LS-DYNA print_lso_doc. |

Remarks:

1. If LCDT is nonzero, then it is used and DT and NPLTC are ignored. If LCDT is zero and NPLTC is non-zero, then NPLTC determines the snapshot time increment. If LCDT and NPLTC are both zero, then the minimum non-zero time increment specified by DT is used to determine the snapshot times.

10-12 (LSO) LS-DYNA R12

*LSO_VARIABLE_GROUP

Purpose: To provide a means of defining a shorthand name for a group of variables. That is, wherever the given group name is used, it is replaced by the list of variables given in this command. Note that for the single-precision version of LS-DYNA, the only allowed value of SOLVER_NAME = MECH.

| Card 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|----------|---|-------------|---|---|---|---|---|---|
| Variable | | SOLVER_NAME | | | | | | |
| Туре | | Α | | | | | | |

VARIABLEDESCRIPTIONSOLVER_NAMESelects the solver for which data is output in a time sequence.

LS-DYNA R12 10-13 (LSO)

| VARIABLE | DESCRIPTION |
|-------------|---|
| DOMAIN_TYPE | Name of the type of domain on which each VAR_NAME is defined. |
| GROUP_NAME | Name of (or alias for) the group of names given by the listed VAR_NAMEs |
| VAR_NAME | The name of an output variable computed by SOLVERNAME |

Remarks:

1. Valid VAR_NAMEs depend both upon the SOLVER_NAME and the DO-MAIN_TYPE. These variables are listed by DOMAIN_TYPE for each SOLV-ER_NAME in a separate document. This document (LSO_VARIABLES.TXT) is created by running the command: LS-DYNA print_lso_doc.

10-14 (LSO) LS-DYNA R12

LS-DYNA R12 10-15 (LSO)
